SimCity has been out on the ST for YEARS. The Jag does not use the 68000
like the ST does, and SimCity could be very easily done on the Jag. In fact,
the Jag could make for a most interesting platform for the game....
SimCity 2000 could be REALLY nice.

SO you don't know it yourself ... this is the problem with multimedia
isn't it ?, i don't see _one_ point yet why the jag is a multi-media
machine and a snes is not ...

I feel the cd32 is a multi-media machine because it lets you do 70% of
the normal things multi-media is (atleast what i feel is multimedia until
someone CAN tell me what it is). And the other 30% can be added ..

1) It has a multitasking-OS this is a must for multimedia.
2) It has the software (scala, helm, mediapoint, dpaint, toaster, real3dv20).
3) Lets you use its output on video (both pal/ntsc & others) for titling
kiosk systems etc etc
4) Lets you combine external video & internal video (grabbers, mpeg,
laser-disk, video, other computers). (ive use 2 amiga's in a project
to get the wanted effects).
5) Lets you interface to host systems and other cd32 using anything from
envoy (peer to peer) to tcp/ip (nfs to share harddisks, cdrom). This is
not a future thing i know 3 projects at in make right now that use
more than 50 cd32 each.
6) Mixing, sampling in and external sound possible (its not 16 bits in
the cd32 (exept the cd).
8) All the normal cd-hype-things like audiocd,karaoke,cd-g,cdtv,sierra,
9660,photocd,twinspeed,multisesion right out of the box. (It even
seems possible to have FULL control/access to the cd ALSO the audio
data on a normal cd (im checking this out, will make a great sampler/
converter).
9) Easy use so users themself can change things using programs that can
run from the host system or the cd32 itself (arexx, scripts, dpaint,
scala etc etc).
10 has the option to grow in the areas needed (cpu power, cdroms, memory,
harddisks etc etc).

cbm decided to call/push the cd32 as a games machine but its a full amiga
with al of its good & bad points right out of the box.

I had Sim City for the 1mhz 6502 based C64 and it ran at a decent
speed. I'm sure the Amiga and ST versions ran find with a 7mhz 68000.

O not again... the PowerPC is a nice cpu but not the only one getting
support by big names.

>There's no way anyone will be able to keep a small marketshare when the PowerPC
>is faster than everything else, can run any OS, can use any add-ons ... (or so
>it should be ...)

A cpu that can use addons ??? please explain, anyway its not the fastest
nor the only one big brands are behind. The alpha & HP/PA chips may have
a future too. most will run all the next line of OSes and will use
PCI (including the next amiga's) ...

Kendall Gelner (kgelner@nyx.cs.du.edu) wrote:
:#Is was not just the cost of NEO-GEO roms - it was a small market,
:#combined with the development cost of the games.

How does that differ from any other company with a new machine? Small market and development cost of the game doesn't justify the cost of the games which were >$100. Turbo-grafix games which had a small market and a subsequent development cost just like any other platforms didn't cost >$100 per game. The only differences between the two were that Neo-Geo games had larger carts. Even when Genesis and SNES games were first coming out, the cost of the carts were no where close to $100, and their carts were nowhere close to the size of the carts of the Neo-Geo. I think if you look closely enough you ought to find some correlation between larger cartridges means larger costs.

:#Also, look at 3DO game prices for a similar effect - even Dragon's
:#Lair, where they just have to plop the video on the CD, then throw in
:#the control code, costs $50 - as do pretty much all of the 3DO games.

Look at their other games and tell me any of them cost >$100. 3DO has a small market currently, high development costs (new machine, expensive development systems), yet I have to see a game that costs >$100.

On the other hand, I've yet to see a Jaguar game cartridge that uses close to the limit of the cartridge size. Until they come out and they cost <$100, then I'll believe that Jaguar cartridges will not suffer the fate of Neo-Geo cartridges.

:#I think Commodore has a good marketing strategy by charging
:#lessroyalties on cheaper disks - but, when you start to see real
:#titles that take advantage of the CD rather than ports of old games,
:#the cost will rise. How much does liberation or the pinball title
:#cost?

Not sure of Liberation, but I believe that Pinball Fantasies was being included with another game in Canada with the CD32. I believe these machines came through Canada via the UK. Maybe someone in UK can actually verify this. Current prices I've heard about CD32 games have been from $40-$60. I consider most of the CD32 games to be taking advantage of the CD, I'd really like to find out why you consider they don't take advantage of it? It is primarily a storage device, most of the games coming out are >110 MB. Defender of the Crown II which is a CD only game is about 150 MB. Many games have CD quality music included, and/or animation sequences and/or extra levels.
What else were you expecting that I'm missing?

:#I still tend to believe that the cost of large games is going to
:#overwhelm the media cost - and this still does not account for the
:#fact that a lot of PC games are pretty expensive, yet are distributed
:#on disks that cost almost as little as a CD.

If there is no reason for the high cost of something, I usually attribute it to greed. Considering that you have to spend a little extra to purchase a CDROM player for a PC, the developers are probably considering that consumers are willing to spend a little extra for the game to come out on a CD. This is not necessarily true, just my thinking.

Hey, get real, What you are saying here is that just because a computer uses the
PowerPC it will be able to run "any" OS and use "any" add-ons, so I assume the
next PowerPC generation computers will be able to download pizza too. :)

Well, I myself think that "Multimedia" is a wavering thing that can be
said of many things... but let's look at this list:

>
>1) It has a multitasking-OS this is a must for multimedia.

What multimedia things have you seen that let you do a bunch of things
at once? In general, multimedia eats as much processor as it can get
- you you will not want anything else running at all. Indeed, a
simple OS with no multitasking is probably best for stand alone
applications...

>2) It has the software (scala, helm, mediapoint, dpaint, toaster, real3dv20).

The Amiga does... but don't forget that the CD-32 has only chip-ram,
reducing its speed and therefore responsiveness.

>3) Lets you use its output on video (both pal/ntsc & others) for titling
> kiosk systems etc etc

But the 3DO does this to... well, with an optional attachment.

>4) Lets you combine external video & internal video (grabbers, mpeg,
> laser-disk, video, other computers). (ive use 2 amiga's in a project
> to get the wanted effects).

Both the Jaguar and 3DO have networking capabilities too.

>6) Mixing, sampling in and external sound possible (its not 16 bits in
> the cd32 (exept the cd).

Possible also on the Jaguar and 3DO, I'm sure.

>8) All the normal cd-hype-things like audiocd,karaoke,cd-g,cdtv,sierra,
> 9660,photocd,twinspeed,multisesion right out of the box. (It even

> converter).

3DO and Jaguar will have this also - and the 3DO comes with Photo-CD
(a real must for multimedia buffs).

>9) Easy use so users themself can change things using programs that can

That is what I don't like about the CD-32 - why not just get an A1200,
and a CD-ROM? The market before in the US has consitantly shown a
loathing for machines that try to be a computer and game console.
They typically wind up being poor for both tasks.

P.S. - since this is Atari.Advocacy, let me just add that the Falcon
is a pretty darn good machine for multimedia from the technical
standpoint - just that the software is a little slim right now. And
don't give me lip about the 16-bit daatbus, when CHIP-ram only CD-32's
are considered good multimedia machines...

Rom prices do factor in somewhat for the Neo Geo, but only because of
the huge (much larger than the jaguar maximum) rom sizes for the
carts. Samuri Shodon is something like a 200mbit cart! Of course at
some point media cost will take over, but the rom price for 6MB or so
is small enough that the price will not be affected that much -
perhaps a $10 increase over CD-ROM price.

The CD musioc is ok... the animation sequences are more like it. But
as far as I can tell, there are not a lot of games doing this. What I
really want are a lot more things in the game, for the game to last a
lot longer. The extra levels are right on, but again - how many games
really have this stuff?

The CD-ROM CD-32 prices also are the same as the Jaguar cart prices.

What seems criminal to me are the smaller games being released for
those kind of prices.

>:#I still tend to believe that the cost of large games is going to

But a good CD-ROM game has a lot of space to fill - animators, actors
and just plain time spent oragizing large amounts of data take time
and money.

SimCity should work fine. SimCity 2000, SimEarth, SimHealth, etc probably wouldn't be very fun on a 68000. It's just way too slow. I bought Sim Earth for my Amiga and it really was slow. The thing flew on my friend's 386dx40. Though, it was a rash purchase as the game is way too deep for me anyway.

>What multimedia things have you seen that let you do a bunch of things
>at once? In general, multimedia eats as much processor as it can get
>- you you will not want anything else running at all. Indeed, a
>simple OS with no multitasking is probably best for stand alone
>applications...

Thank you for showing you have _NO_ clue about how we use this on the
amiga system, the combination of more than 1 program is normal for
a few reasons. Lets take scala as a example its a fine program but its
not a end-all-because-it-has-all THATS NOT WHAT MAKES IT SO powerfull
(that even IBM & Apple use them for there pressentations) is that it
lets you combine internal programs & data with external programs & data.

Example lets make a program that is controlled by voice commands and gets
raw info (lets take a vote program for tv) from a few frontend computers.
the numbers have to be combined a picture created to be shown by the
system if the voice module wants it.

scala can't do direct networking ..
scala can't create good looking bars & put them in lets say they map of USA
scala has no voice controller.

SCALA HAS AREXX

So we run a network to the other (in this case 2) computers that gives
you results they are precalced and a Arexx script is made and sent to
adpro (that is also running) creates the different iff pictures to be shown.
vcli is used to to the voice detection so when he hears a command he knows, he
starts the correct arexx script that controls scala to show you the correct
picture & results.

Simple no ? but keep in mind both the the input stream is comming in
all the time (or atleast not in a ordered way) and the results can be
asked for all the time (if they are ready ofcource).

SO there are 6 (and some smaller, normal prg) programs running :

- network to the frontend computers.
- a small (fast made c program in fact) program to combine the results
and create (change more) arexx for adpro.
- adpro (waiting of working on adding the numbers in the pics).
- vcli (waiting/sampling/checking) for voice commands & starting arexx
scripts.
- scala (multi media program).
- arexx (to connect all the programs).

Ofcource you can DO THIS SOMEDAY with both the jag & 3D0 but this is
not the point now and if you ask me it will cost you more because most
parts do not exist yet. Ofcource this is not a maybe case, this system
(exept for the voice commands it was a sort of joystick thing) was made
& used on dutch tv (yep when the Mister Clinton was the winner).

>>2) It has the software (scala, helm, mediapoint, dpaint, toaster, real3dv20).
>
>The Amiga does... but don't forget that the CD-32 has only chip-ram,
>reducing its speed and therefore responsiveness.

huh ? 3 remarks most tv type screens have almost no bus-problem, second
point is that the cd32 will not be a dead system fastmem & turbo cards
will be with us soon (or are allready done). Lats point most of the
effects will be cpu-cheap because they are done with the blitter & copper
only FMV will take much time (running a full mpeg stream & sound takes
up to 40%-50%).

>>3) Lets you use its output on video (both pal/ntsc & others) for titling
>> kiosk systems etc etc
>
>But the 3DO does this to... well, with an optional attachment.

Oke it will be with us soon but things add up we want them cheap (a vriend
of my is will use 60 in a project soon).

>
>>4) Lets you combine external video & internal video (grabbers, mpeg,
>> laser-disk, video, other computers). (ive use 2 amiga's in a project

>
>Both the Jaguar and 3DO have networking capabilities too.

Sure they will have some, but they won't be all sorts of networking
& will not come cheap. (maybe this will change if the top-set idea's
for the jag & 3d0 are a hit).

>>6) Mixing, sampling in and external sound possible (its not 16 bits in
>> the cd32 (exept the cd).
>
>Possible also on the Jaguar and 3DO, I'm sure.

at a higher price sure they _can_, btw is there a port extender comming
for the jag to to hook up all there cables ?

>>8) All the normal cd-hype-things like audiocd,karaoke,cd-g,cdtv,sierra,
>> 9660,photocd,twinspeed,multisesion right out of the box. (It even

>
>3DO and Jaguar will have this also - and the 3DO comes with Photo-CD
>(a real must for multimedia buffs).

Thats why cd32 has photocd ;-) (the software of atleast 3 makers was ready
but the licence was not given until a few weeks ago).

>>9) Easy use so users themself can change things using programs that can
>> run from the host system or the cd32 itself (arexx, scripts, dpaint,

>They typically wind up being poor for both tasks.

So if this is true cd32 will be a flop in the states ... and yes the
idea is to make both options possible get a cd32 and then a keyboard
and a harddisk OR get a a1200 and add a cd1200.

>P.S. - since this is Atari.Advocacy, let me just add that the Falcon

----

Thats true ofcource but capable is NOT enough.

>standpoint - just that the software is a little slim right now. And
>don't give me lip about the 16-bit daatbus, when CHIP-ram only CD-32's
>are considered good multimedia machines...

I allready stated the falcon is much better than a plain a1200, again
if need be add fastmem or a turbo card or a harddisk or a vcr or a fill
in yourself ;-).
If you want my idea's about the falcon is that is the wrong machine
for the there own user base, to much money for the most st users &
not enough power for the TT users IMHO a falcon with ONLY a dsp as
extra (maybe a '20 but i heard they got a good deal on the '30) and
a fast '30/'40 in a mega-type case with all the extra's.
Lets be fair how many people in the 1040-range will have several systems
to network for example.

mind you, isn't the 68K chip in the Jag at 16MHz instead of the 8 of the ST?

That is one aspect, but once again for standalone apps (like a setup
in the mall or something), you do not need multitasking.

<rest of complex example deleted>

Actually, I think when most people think of multimedia, they think of
Hypertext like systems with video and audio capabilities. What you
described is very nice, but is not nessicary at all for most
multimedia applications. For the developer it will be invaluable, of
course, but for the user not nessicarily so.

>>>2) It has the software (scala, helm, mediapoint, dpaint, toaster, real3dv20).

How many people do you really think will buy fastmem upgrades etc,
etc, etc? Remember, it is the Amiga people claiming that you cannot
consider the Jaguar's CD-ROOm because it comes seperatley.

Let me also straigthen something out - you are saying that the CD-32
can do a full MPEG stream with no cart, using 40-50% of the processor?
No Way. If that is with the cart, then, I'd have to ask what the hell
the processor is doing in there - it should just let the MPEG cart
go.

The Jaguar at least will have cheap options - it includes a comlynx
port, as well as a ~2MB/sec serial port. Connecting to cable networks
will probably be somewhat expensive (as everything dealing with cable
systems is), but just linking many jags together will be very cheap.

You can make one if you like! They already have the S-Video and
Composite cables out, if you prefer to buy them.

>>>8) All the normal cd-hype-things like audiocd,karaoke,cd-g,cdtv,sierra,

Aren't the A4000's also rather expensive for the user base?

Well, I do - but then I am not a typical user. I do agree that the
Falcon is priced a bit high, but it has already come down from the
original price... and I still don't regret at all the purchase of
mine. Though I would like an accellerator card...

Actually, I was told Sim City 2000 was 90% / 10%. I don't know the game.
Could this obvious sequal make a difference? I know the original Sim City
made it to a lot of 68000 platforms.

>

Well, in the Falcon, you can also use the DSP for:

Sound Effects while recording 16-bit stereo sound
Loading JPEG pictures faster than a 486/50
Playing MPEG movies at 12fps
Voice mail applications
And other things - since it is in every machine, it really has some
interesting stuff being developed for it! How many apps for the
Amiga are there that use the AT&T chip?

>: Super VGA graphics: 640x480 with 256 colors

When Atari (and many others, I was tought this definition in my
computer graphics class as well) refers to true color, it means a
color mode (in this case 16-bit) with no lookup table. I will
not expound on this topic further, it has been done beyond death.

>: Optional internal IDE Hard Disk
>
>So no HD included (even if the SCSI is supported).

Wrong again, the HD is included on almost all models - if you want to,
though, you can get one without an HD so you can add a large external
SCSI drive. Do you mean to say that I cannot buy an Amiga without an
HD? How Communist.

>
>: Pre-emptive Multitasking with adaptive prioritzation (MultiTOS)

Gee, MTOS has memory protection, sockets, and is almost fully POSIX compliant, and has loadable filesystems (giving me a mix of UNIX and MS-DOS filesystems). I use it all the time, and it has a better interface than Windows! Since the Amiga OS lacks many of these features, I guess I'd jast have to call it an even worse hack, with no thought to the future (like device independance, or code portability). I think the Amiga OS programmers could learn a few things from the Atari OS...

>
>: Multiple window user interface; number of windows limited

So you are saying that the Amiga cannot have as many windows open as you want? I think there are a few Amiga owners that would argue that point with you... ;-)

I apologize to regular readers of both groups for this post, but I had to clear a few things up.

Can it do multitasking? Play sound and load JPEG's at the same time?

> How many apps for the
> Amiga are there that use the AT&T chip?

None, as far as I know. Commodore is waiting to release it I think?
The good thing with AT&T chip is that it already has a good software
from AT&T itself - including multitasking. The downside is
that it isn't really available yet from Commodore or it isn't standard
for current machines. However it will be standard in high-range AAA

machines which are supposed to come late this year. (this was taken
from one of the Dave Haynie interviews I have read)

Amiga base OS lacks memory protection, sockets (are available as a standard
amiga shared library I believe) and it isn't POSIX compliant. I believe
it has loadable filesystems if I understand right what you mean with
it. There is a lot more to Amiga OS than you can easily see when looking
at the Workbench screen. For example the new Localisation/datatypes/BOOPSI
etc... systems are very nice.

And what do you mean that it has no device independence or code
portability? Do you mean that it doesn't have device independent graphics?
Could you explain little further?

> I apologize to regular readers of both groups for this post, but I had

I assume your Amiga 68k is running at the usual 7.8Mhz or whatever? If so
you'd expect a 40Mhz 386 to be faster - 5 x or thereabouts.

Iain

This game is very cool once you get into it. For about the first hour it more or less sucks. But once you learn to fly well and see some of the "neater" stuff, it is very fun...

>In a press release dated 15 Dec 1993, Atari US have reported production

>available in large quantities around March next year.

To be honest, my Jag would not play Trevor Mcfur when I bought it. So after I tried the cart on two other Jags (and it worked) i got my Jag replaced (Circuit City, didnt give me any hassle). Works fine now. But it was weird that Cybermorph worked, but not McFur . . .

>began to see life again and by the official announcement of

Hmm.... The cd 32 is the ONLY game machine I have heard about but never seen in a U.S. store... I wonder if dominating the netherlands will be enough?!?!

This is ridiculous. If you think Sim City (even Sim City 2000) is doing
extremely math intensive simulation, well . . .

(Then maybe you need to play it! . . . .) It is primarily the graphics
that are slowing it down on my Macintosh. The simulation, while fun, is
pretty much formulaic.... It sort or like an untra evolved version of "Life"!!

Daniel Ockeloen <daniel@blackhl.hacktic.nl> wrote:
>>Multimedia is a stupid term. It means whatever you want it to mean. It means
>>pictures, sounds, text, video, and/or whatever else you want to throw in.

This is true. It is a catch phrase that doesn't mean much. The only
real definition is that it combines text, audio, and video. Pretty vague
huh? (Of course, if you read the news, one Dictionary company that made
a CD-ROM a while back was awarded a patent on multimedia, and the judge
said that every user of multimedia would have to pay royalties. This
was then suspended by the patent office, and is now under re-evaluation!)

>I feel the cd32 is a multi-media machine because it lets you do 70% of
>the normal things multi-media is (atleast what i feel is multimedia until
>someone CAN tell me what it is). And the other 30% can be added ..

I would say the CD32 is deffinately "multi-media". Has anyone argued?

>1) It has a multitasking-OS this is a must for multimedia.

Not relevant. Certainly nice, but in reality has no fundamental part in
multimedia.

>2) It has the software (scala, helm, mediapoint, dpaint, toaster, real3dv20).

Also not really a relevant point.

>3) Lets you use its output on video (both pal/ntsc & others) for titling
> kiosk systems etc etci

I would say this is a fairly good point. Maybe not essential, but
some sort of useable video output is fairly important.

>4) Lets you combine external video & internal video (grabbers, mpeg,
> laser-disk, video, other computers). (ive use 2 amiga's in a project
> to get the wanted effects).

More of a use than a definition. But this is nice.

Ack! I am out of time. Anyhow, just wanted to say most of your points
are good in that they are nice uses of multimedia. Most of them are not
fundamental to "multi-media" but are instead applications....

The Jag claims it is multimedia. Why? Well they plan on having a CD
ROM soon. This is the most common thing that normal people (computer
fools?!?) consider multimedia.

The jag has some built in support for codecs (for example Atari has
liscensed "Cinepack" from SuperMac technologies for video (de)compression.
This is the same software IBM and apple plan to use, as it seems to be

faster and "better" than mpeg-2).

The jag has high resolution (around 750x580) in 24 bit color. This is sometimes considered an aspect of multi-media.

I personally enjoy the fact that the Jag will be able to use a CD in conjunction with a cartridge, if any one does indeed use this capability. A game that came on cart and CD could be VERY fast and still enjoy video and cd audio).

Well enough. Multimedia is a dumb term. The jag is "more" qualified to do multimedia that a SNES (for the reasons I listed). With the current games, I agree, it is no more multimedia than the SNES, and less that the CD32 and Sega-CD (and 3d0 . . .) But the capabilities are there. Just need to see what people do with it.

22. Multimedia crap

Newsgroup: comp.sys.atari.advocacy

Okay, that's enough multimedia junk on here. Would someone please post the
the information in an Engineering Times (or was it News, dang! I forget which)
which contained their definition of Multimedia? It seemed pretty unbiased
(and seemed to require at least a Sparc workstation or so).

Michael White

So we (only 2 people) can't get the multi-media thing correct, lets stop this we will not come to valid def. for multi-media.

>Actually, I think when most people think of multimedia, they think of
>Hypertext like systems with video and audio capabilities. What you
>described is very nice, but is not nessicary at all for most
>multimedia applications. For the developer it will be invaluable, of
>course, but for the user not nessicarily so.

Thats fine by me, the only thing i find weird than is WHAT is new ?, we all have hypertext like things, graphics & sound for years why do we call it multi-media now ?

>>huh ? 3 remarks most tv type screens have almost no bus-problem, second
>>point is that the cd32 will not be a dead system fastmem & turbo cards
>>will be with us soon (or are allready done). Lats point most of the
>>effects will be cpu-cheap because they are done with the blitter & copper
>>only FMV will take much time (running a full mpeg stream & sound takes
>>up to 40%-50%).

Oops i f*cked up ... sorry folks.

>How many people do you really think will buy fastmem upgrades etc,
>etc, etc? Remember, it is the Amiga people claiming that you cannot
>consider the Jaguar's CD-ROOm because it comes seperatley.

Thats because the Jag will gain MUCH more from a cdrom than a cd32 from some fastmem, and for people getting the hardware ?, not sure but most will get them for free because they will go from a1200 or a4000 and add the cd-unit so when i ad the cd4000 unit i will have a cd32 with a 68040 & 14 mb ;-).

>Let me also straigthen something out - you are saying that the CD-32
>can do a full MPEG stream with no cart, using 40-50% of the processor?
>No Way. If that is with the cart, then, I'd have to ask what the hell
>the processor is doing in there - it should just let the MPEG cart
>go.

Sorry (see the Oops above) THIS IS WITH the mpeg module and i have NO idea why as much as 50% if gone on a full screen. (i will send a message to the cbm guy who made the fmv unit and ask him, will report back on this).

>>
>
>And fastmem, turbo cards are free?

Only 1 or 2 will need them (they will be a4000 if possible).

>The Jaguar at least will have cheap options - it includes a comlynx
>port, as well as a ~2MB/sec serial port. Connecting to cable networks
>will probably be somewhat expensive (as everything dealing with cable
>systems is), but just linking many jags together will be very cheap.

You got me there the 2MB/sec is nice can you tell me what chip is
feeding this & how much power it will take (ie is it polled by a chip ?).

>>at a higher price sure they _can_, btw is there a port extender comming
>>for the jag to to hook up all there cables ?
>>
>
>You can make one if you like! They already have the S-Video and
>Composite cables out, if you prefer to buy them.

yes but can you connect more than one ? let say 3 or 4 dif. types
of cables (networking, soundsamplers, VR input etc etc).

>But this is also - availiable seperatley (also on the Jag, to be
>fair). How much will the Photo-CD software cost?

cheapest is free (PD) others are all around $50 (again we may see
cbm chipping it with photocd soon).

>>So if this is true cd32 will be a flop in the states ... and yes the
>>idea is to make both options possible get a cd32 and then a keyboard
>>and a harddisk OR get a a1200 and add a cd1200.
>>
>
>Well... you said it, not I! :-)

YES I DID, i try to be realistic ... even think it will be 40/60 it WON'T
be a real hit in the states .. but then again this is NOT the main cbm
market.

>>I allready stated the falcon is much better than a plain a1200, again
>>if need be add fastmem or a turbo card or a harddisk or a vcr or a fill

>>extra (maybe a '20 but i heard they got a good deal on the '30) and
>>a fast '30/'40 in a mega-type case with all the extra's.
>>Lets be fair how many people in the 1040-range will have several systems
>>to network for example.
>>
>
>Aren't the A4000's also rather expensive for the user base?

Yes if cbm ONLY gave us the a4000 they would be DEAD rigth now, the
idea was (and i think this is valid) to spit up the usebase just
like they did with the a500,a2000,a3000 so you will make upgrading
possible at about the same price (or less) they payed for there
old machine some years ago.

a500 -> a1200 (about the same start price)
a2000 -> a4000/30 or a1200/30 (depends on your a2000 setup)
a3000 -> a4000/40 (much cheaper than the a3000 start price)

>Well, I do - but then I am not a typical user. I do agree that the
>Falcon is priced a bit high, but it has already come down from the
>original price... and I still don't regret at all the purchase of
>mine. Though I would like an accellerator card...

Thats the problem isn't it most people can't get neat systems like
we can ;-) ... i can get a 4000/40 (as i did) but im not a normal
user.

You must not own one. I find it to run at a pretty reasonable speed,
even while running Multitos. Would I like it to be faster? Sure,
perhaps I'll buy one of the speedup boards someday. but I am
completeley satisfied with what I got, and it is a lot faster than the
ST's are, with a much larger screen size.

No, of course not. Can your printer print two documents at the same
time? It is treated as a resource by the OS, that can be locked for
use by one program. I can just use the DMA sound stuff if I want
music going while I decompress a JPEG, or better yet turn on the CD
player and put in some Wierd Al or They Might Be Giants. ;-)

Is not one chip that you can do one thing at a time on, better than
none that you can do nothing on?

That's what I like about the DSP in the Falcon - whatever your opinion
of it, it is standard and uses OS calls for access, so it is easy and
reasonable for developers to provide DSP support on the Falcon where
applicable.

>etc... systems are very nice.

>

The loadable file systems allow any number of different file systems
to be loaded as modules at bootup, and used on the system
simultaniously. For instance, I have a number of MS-DOS and Minix V2
partitions on my Falcon. Any program can use files on either file
system with no problem. While currently the only other loadable file
systems that exist are the minix, CD-ROM, and ramdisk FS's, you can
write others... I am trying to get my hands on the Mac Fs specs so
that i can try to write a Mac FS (should allow you to read HD mac
disks at any rate, and access the mac partitions on the system if you
have an emulator).

In all fairness, MTOS does only provide memory protection on a 68030 -
you can run MTOS on a 68000, but it will be slow and memory protection
will not work.

>And what do you mean that it has no device independence or code
>portability? Do you mean that it doesn't have device independent graphics?
>Could you explain little further?
>

Well, the POSIX compliance is a part of that - it sure helps a lot
when bringing code from unix systems, and in general lets you use
stuff the rest of the world is using (useful job skills). I'll admit
not knowing a lot about the Amiga's device independant features, but
the Atari OS has always had good resolution independant graphics and
device standards, even if they were not followed at times.

>
>Me too, but just had to straight some facts. :)

Well, nice to have a pleasant chat for a change!

Actually, I would be interested in further postings on some of the
stuff mentioned above like Localisation/datatypes/BOOPSI (sure that
isin't an MKII thing? :)), just to beef up my knowledge of the newer
stuff on Amigas.

HOLA -
Thanks, got it, didn't look under the American exchange, where it lists as Atari.
No flamage, but wasn't it trading at better than $10 when the Jaguar was announced? How rapidly did it drop, if indeed it did? And it's well above where it was prior to the jaguar announcement (under $2 ?), correct?

Thanks for any further info,
Ivan Ivanick esrlpdi@mvs.oac.ucla.edu

I'm not so shure about that. If you place an interrupt routine on the sound
DMA and do a JPEG as the main program... Well this is not multitasking but
simple interrupts, but it is possible to do 2 things at the same time.
BTW, the 56000 in NeXTStep 3.0 can 'multitask' in the way that you can play
several sounds at the same time and they are simply mixed together. So it
it rather a software problem than a hardware problem to do multitasking.

Or has the ATT chip special multitaks registers or so. I would like some specs.

The 56001 doesn't generate sound on the Falcon. It can be used to manipulate sound though. It would be safe to say then that a Falcon could play sounds while doing JPEG decomp.

Well, what Atari had in mind was most likely the CD-ROM option for movies and
the expansion bus for hookup into cable networks.

>>>I feel the cd32 is a multi-media machine because it lets you do 70% of
>>>the normal things multi-media is (atleast what i feel is multimedia until

>>
>>Fine, what your point?
>>
>
>I listed what IMHO is the main things behind multimedia... that it noting
>more ...

Like I said, what is your point? Lots of machines can call themselves
"multimedia machines", for lots of different reasons. And they all are,
because there is no one true definition. All I'm saying is that the Jaguar
is every bit a "multimedia machine" as any machine out there. And that's
all that matters.

Tom

No it doesn't have extra (for a DSP) things to do this in hardware the trick
is in the software ATT ships it to apple (for the mac) and to cbm with a
kernel (vcos, apple changed some parts and called it arta) its a full
multitasking preemptive os running on the chip. This and the tons of
software for vcos makes it a better choice IMHO. in the jag a 'pure' dsp
will be better on a real computer you want to slice the power for more than
one task at a time (lets say mixing 2 channels takes 3 mips on a 5600x,
its a waste on the rest of thge power). Im not sure if this thread started
on the dsp-module for the amiga but its ready (and has been ready for more
than 2 years!!) but they don't want to make the module they want a 3e
party to market & sale the produkt. It will be standard on the AAA
machines. The DSP module will be to boost overal machine performance maybe
for sound but most of that will be done with the 8 16bits 100khz voices.

Greetings,

Daniel.

PS: I am working on a OS/kernel for a TMS320C40 network (very powerfull DSP
from TI), if you want i can get more specs about vcos and/or the 3210
for you.

Today Atari closed at around 6 1/8. That was what it was at around 3 pm today. Don't know what it ended up at. Yes it reached a high of 12 and something. It dropped in about 3 weeks and had to due with an announcement made by some analysts basically saying Atari was not worth 12. In my opinion they are wrong. Atari as you said is on the American Exchangee . In the paper its under Atari, but its proper symbol is ATC.

I am biased since I own a jaguar and a lot of atari stock. I thnk many people (non-atari people) will be suprised later on in the year when Atari jumps way beyond 12.

Alex

33. The fate of the Lynx

Newsgroup: comp.sys.atari.advocacy

Source record: 19432

What's the future of the Atari Lynx? I noticed that Toys R Us discontinued it and so did Electronic Boutique. The only places that still carry it in my area are Babbages, The Good Guys, and a few independent outlets. How did this happen? I tried both the Lynx and the Game Gear before I bought the Lynx and I found the Lynx to be far superior. Atari has got to get it together and market the Lynx better. They apparently have a NFL football promotion for new units and only one dealer knew about it. I had to call Atari to verify that it did indeed exist. What are the chances that the Lynx can make a comeback now that Atari has the Jaguar out there?

>made it to a lot of 68000 platforms.

I've seen Sin City 2000 now (running on a Mac LCII) and I can say that what
appears to have been worked over is the graphics/sound/presentation. I am
not convinced that the actual SIMULATION part would use that much more
processor time than the normal Sim City. So this might be a SAFE assumption.
It does take on the appearance of using more processor time for calculations
however, because the CPU has had additional graphics and SOUND (that's the
big culprit) that slows down the processor. It would probably run fine on
a Jaguar. You _MIGHT_ be able to get it up and running on an ST, or even a
mac plus, without the sound mind you.

Yeah, this multimedia thing is pretty vauge... I really do doubt that
you can find two people with the same definition. Heck, I'm not sure
I could give an exact definition if pressed...

>
>>Actually, I think when most people think of multimedia, they think of

>Thats fine by me, the only thing i find weird than is WHAT is new ?, we
>all have hypertext like things, graphics & sound for years why do we
>call it multi-media now ?

Well, when I think of multimedia I think of combos of all of these -
which have been hard to do on home platforms until now (I feel like I
should say that having video portions is a must to be multimedia, but
I guess graphics will do).

<some stuff deleted>
>>How many people do you really think will buy fastmem upgrades etc,

That does sound like a good multimedia unit. That's what always made
more sense to me - buy a CD-ROM for the A1200.

>>Let me also straigthen something out - you are saying that the CD-32

I thought that all of the MPEG carts pretty much just played the
movies with no assitance from the unit... perhaps this is all sound
processing? Pure speculation on my pat, of course.

Well, they have the video port, the cartridge port, the serial port,
and the DSP port. I think the comlynk port is part of the serial
port. At any rate, you should be able to hook a lot of stuff up at
the same time.

>>But this is also - availiable seperatley (also on the Jag, to be

Well, $50 is not too bad, but it would be better to include it with
the CD. This is my only gripe about the ATari CD - it will also have

Photo-CD seperatley (perhaps they will change their minds later).

Well, I suppose you could write a small multitasking kernel... but
then you would loose a lot of the speed beenfits that make the DSP so
nifty. I really do prefer to think of it a single resource to be
shared by the system - I think the locking mechanism in place is a
pretty good way to handle it.

There is also the problem of upholding the "DSP multitasks" claim - it
is much easier on all I think just to concede that you won't really be
multitasking on the DSP. :-)

I also don't really feel it is right to call mixing a multitasking
kinda thing... when I think of DSP multitasking I think of seperate
programs using the DP and having the whole DSP memory and state and
everything swapped out on process switches, or at least switches that
go to another program using the DSP. This is what is pretty hard (and
also costly in time).

>
>Or has the ATT chip special multitaks registers or so. I would like some specs.
>

I think that one thing that makes the AT&T version so much more
friendly is that it uses the same memory the computer does. A nice
idea, but it means $$$ for memory. Also, the AT&T chip itelf is not
exactly something you find in a box of Cracker Jacks itself, if ya'
know what I mean... :-)

Pretty good, I think - for instance, I have heard they are devoting
about 1/4 advertising time for the Jaguar to promote the Lynx. Toys
'R Us and Babbages will be carrying the Jaguar, and Atari wants to try
and get all of its Jaguar distributors to also sell the Lynx.

First of all: the DSP is independent from the 68030, so with a little
knowledge you can depack JPEGs with the DSP while the 68030 is playing some
nice MODfiles with 50 KHz. There is no need of Multitasking at all.

The only problem is the transfer of data to and from the DSP. In this case
this is no problem, because even with the DSP the depacking of (for example)
a 320x200 JPEG with 64K colors needs 5-10 seconds. That makes in the worst
case 25 Kb/s.

Ciao, Heiko.

>straw too!

Not really, what C= did was to produce a CD-console based heavily
on an existing computer which already was competing (in areas) with
the console market. The only developement work they did was to make
the Akiko/CD controller chip. Viola - one ready made console specs
better than Sega/Nintendo and a wide variety of games already
available. By pricing it as they have done they stand to sell a
load of the machines and also to reinvogorate the Amiga games market
at a stroke. There was no risk inherent in manufacturing the machine
- but obviously if it does flop, C= would revert to their dodgy
position.

Atari have produced a `Super Console` but they have spent a lot
doing it. They launched too late for the Xmas period this year and
missed a LOT of potential sales. If it`s successful, Atari will
continue as a games console company. If not, then they are dead.
Either way, their home computer line looks to have a dim future.
Maybe they will make a `Super Falcon` with the Jaguar chipset and
,say, a 68030 (With full 32 bit memory access this time).

Atari fans seem to miss the point that a system needs software
to survive and thrive. Unless we see lots of excellent software for
the Jaguar, it has no future - excellent specs or not.

Remember the Lynx???

No - neither do the rest of the world.....

>cost?

The first 2 true CD-only games for the CD32 , Liberation and
Microcosm both cost 30 UKP - with typical UK console carts costing
45-50 UKP for a 1-megabyte cart (and 70 UKP for a 2-megabyte) I`d
say that the CD games are pretty good value.

>I still tend to believe that the cost of large games is going to
>overwhelm the media cost - and this still does not account for the

If companies want to profiteer, then it makes no difference how
much the media costs. I`d say if some company was to make top games
at decent prices then the cost of all games software on that
platform would fall.

Its commonly accepted that a multimedia system requires a large
amount of storage to play all that sound and video from. A CD-less
jaguar would not be capable of multimedia in the accepted sense. If
it was, you could also call the nintendo NES a `multimedia system`.

Just more marketting hype like the `64-bit` tag. Still, at
least Atari seem to be making an effort to market it unlike previous
efforts from them.

Not so. I had heard figures of 50UKP quoted for Jaguar carts in
the UK (The only game so far here is cybermorph). ALL the CD32 games
cost 30UKP or less (There is a growing number of 15UKP priced games
which are simply the Amiga game shovelled onto CD - an excellent
source of affordable, quality software for CD32 owners)

They really did not miss anything - no-one else had anything much out
at christmas either. Consider it "the last year of sega/Nintendo
dominance". (Though Sega has a chance now)

If they are successful, the computer line will probably get more
attention. It is just as easy for me to say that Commodre will never
again make anything but CD-32's, and it would be just as untrue. What
you just do not seem to be able to grasp is that Atari likes the
computer buisiness, and has no plans to leave (as much as you'd like
them to).

I would sure go for a Falcon with the Jaguar chipset included!

It already has excellent software, with more on the way. I'd say the
CD-32 needs to worry a bit harder about this...

> Remember the Lynx???
>
> No - neither do the rest of the world.....
>

But they will, once the Jaguar is out en masse, and carrying the Lynx
with it - that is Atari's plan.

You have forgotten that the Jaguar will have a CD-ROM. You have also
forgotten one other option for a multimedia system - retreiving
information from a cable system, which does not need a CD-ROM - just a
connection to the cable network. The CD-32 does not come with one of
these, does that mean it is not a good multimedia machine? No, but by
your own definition it does.

Actually, we have recently seen that there really is no good
definition of Multimedia - so give up trying.

>

Gee, you're the only one generating factless hype - the Jaguar has a
64-bit bus, with a 64-bit blitter and 64-bit RISC chip.

I still have yet to hear of a single US distributor for the CD-32...

>If they are successful, the computer line will probably get more
>attention. It is just as easy for me to say that Commodre will never
>again make anything but CD-32's, and it would be just as untrue.

It wouldnt really matter that much if commodore did stick to
making CD32s as they are Amigas! You can add a keyboard and
floppy/hard disks to the CD32 and expand it like an A1200. The great
thing about the CD32 is that you are getting a computer capable of
playing great games. The CD32 is packaged to appeal to games
players, but inside it is a full Amiga computer with OS. If needed,
it can be expanded to be used as such. People who already have
Amigas will benefit from more games (due to less CD piracy), better
games (due to mass storage of CD ROM) and access to a good quality
double speed CDROM drive (Adding a CD32 compatible drive to the
A1200/A4000 means you can also read disks like Aminet or Fred Fish,
as well as any ISO 9000 CDROM).

The Jaguar is an excellent console, but NOT a computer and good
sales of the Jaguar will not have any knock on benefit for Falcon
owners like good CD32 sales are having for Amiga owners right now.

>What
>you just do not seem to be able to grasp is that Atari likes the
>computer buisiness, and has no plans to leave (as much as you'd like
>them to).

What you dont seem to grasp is that manufacturers are in
business to make money, not because they `like` an area of
computing. Atari started as a games company and nice as it is to
have a computer line, they are most unlikely to keep making machines
if they sell as dismally as the Falcon has. Before you start hyping
the future of the jaguar, try and analyse why the Falcon and Lynx
have failed to make much impact in their respective markets. Whether
Atari leave the home computer business or not is completely
irrelevent to me. If they make good, well priced, well supported
machines then I`m as likely to buy one as anyone else is. So far,

they HAVEN`T.

>>Maybe they will make a `Super Falcon` with the Jaguar chipset and
>>,say, a 68030 (With full 32 bit memory access this time).

>I would sure go for a Falcon with the Jaguar chipset included!

I`d be very tempted too. Even if it didn`t have a lot of
software, it would be worth getting for the potential alone. A kind
of `luxury` purchase - it`d have to be affordable though... If they
can sell the Jaguar for 200 UKP then I would expect a 4Mb/030
computer to sell around 500-600 UKP which would be very tempting

>> Atari fans seem to miss the point that a system needs software

>>the Jaguar, it has no future - excellent specs or not.

>It already has excellent software, with more on the way. I'd say the
>CD-32 needs to worry a bit harder about this...

It has a very small amount of software, with limited developers
doing work on stuff. You can say that in x months it will have more
software than you could afford to buy, but you could say the same of
the lynx and noone could claim that it has an attractive software
base when compared to the competition.

>> Remember the Lynx???
>> No - neither do the rest of the world.....

>But they will, once the Jaguar is out en masse, and carrying the Lynx
>with it - that is Atari's plan.

It would be nice (I own a Lynx), but I think that it will benefit
from the name of Atari being one of the main players in the console
world if the Jaguar is a success. I doubt that Atari have any sort
of business plan at all judging from their complete mismanagement
and mismarketting since their 2600VCS days.

It may be getting a CDROM at some point in the future, but the
standard Jaguar WON`T be a CDROM machine - it will be cartridge
based. Since all Jaguars currently sold are Cartridge machines, then
they don`t fill the criteria I mentioned. Try thinking about the
words before you reply next time.

The cable option is nice, but again it is `future-ware` and I
doubt that you just plug your cabletv wire into the back of the
Jaguar. Some sort of interface unit will be needed, so you might as
well say that the CD32 is cable capable. At the present time,
neither system can be hooked up directly to a cable network without
(currently nonexistent) add-ons.

Lets just say that only one of these two consoles comes AS STANDARD
with a mass storage system.

As for the multimedia hype affecting sales - well it never seemed
to help the CDi or CDTV sell any more, if anything it confused
people as multimedia is a non-starter as far as the general consumer
market goes.

>Actually, we have recently seen that there really is no good
>definition of Multimedia - so give up trying.

I agree. The only sort of `standard` definition of a multimedia
machine is the Microsoft MPC standard which specifies a CDROM drive,
2 megs memory, 8 bit sound and at least 256 colours on screen. The
CD32 meets the specification (altough the processor is not an Intel,
the power is actually more than tht required by the standard). Since
the bse jaguar does not have a CDROM drive, it does not meet the
standard.

Its fair to say that a CD based jaguar WILL be accepted as a
multimedia platform by anyones standards, and will certainly offer
more power at this than the CD32 could.

I've thought about them plenty - The Jaguar has all it needs to be a
multimedia machine, just beacuse it does not come standard with a
CD-ROM is no reason to say it is not a good multimedia machine.

>
> The cable option is nice, but again it is `future-ware` and I

Which is my point - I would not say the CD-32 is not a multimedia
machine because it currently does not have such an interface. (Ok,
that is a bit convoluted of an example).

>
>
>Lets just say that only one of these two consoles comes AS STANDARD

CDI is making a good comeback - they have had a lot of TV ads latley
and had good sales over christmas. It all comes down to advertising
in the end. If the advertisers can show people why they shoukld want
multimedia, they will buy it - in the CDI's case, it is the existance
and marketing of "Voyuer", an "adult" game for the CDI. This is the
kind of stuff that will create a wide acceptance of multimedia, the
same way it did for VCR's.

>>Actually, we have recently seen that there really is no good

48. CES bits

Newsgroup: comp.sys.atari.advocacy
Date: 1994-01-08 16:20:03 UTC
From: an8496@anon.penet.fi
Message-ID: <162320Z08011994@anon.penet.fi>
Source record: 19299
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.advocacy,comp.sys.amiga.games

some news from CES include the Sega Portable, Trax SFX,
C= CD32 and Jaguar. here is some of the conference thanks
to my cousin with Genie with enough time to get some early bits of
latest CES news and beautify it!

<BOB-BRODIE> Happy New Year, to all of our friends on GEnie!
I trust that you have all enjoyed the holiday season very
much.

<BOB-BRODIE> Activity at Atari is at an all time high as we continue
with the our release of the Jaguar. For the third month
in a row, this session of Dateline: Atari is coming to you
from the road! In November, you may recall that we came to
you live from the New York City Launch event, in December I
was back in New York visiting with retailers. This month,
I come to you live from the Consumer Electronic Show in Las
Vegas. Today's session concluded about an hour ago, and
I've rushed back from the show floor to my hotel room to join
you online tonight.

<BOB-BRODIE> We have lots of exciting news to share with you, so let's
get started right away!!!

<BOB-BRODIE> The Jaguar can truly be called an award winning product!!
Atari was presented with a number of awards so far here at CES.

Die Hard Game Fan Magazine has presented Atari with two awards,
one for Cybermorph as "December Game of the Month", and another
for Jaguar as the Best New Product of 1993.

Video Game Magazine presented Atari with an award for Best New
Product of 1993, and Best Print Ad of 1993 for the Jaguar.

Game Informer Magazine announced at their 2nd Annual Game
Informer Magazine Awards that they have awarded the Atari
Jaguar the Best New Product of the Year award!!

Today, Electronic Games told us that they were naming Tempest
2000 on the Atari Jaguar the award as Best Game of CES!

We're very excited and pleased with all of the accolades that
the Jaguar has earned to date!!

<BOB-BRODIE> Atari has returned to the main floor of CES. Our booth is
located in Pavilion A, rather than using a suite as we have in
the past few years. The amount of activity in the booth has been

just incredible.

<BOB-BRODIE> We have visited by retailers from all over the world, and many prominent members of the media as well. Today we hosted CNN for coverage of the exciting Jaguar title "Alien vs. Predator". We're displaying Jaguars in our booth in the interactive display kiosks that will be available for retailers to utilized. These kiosks feature the striking Jaguar "cat eye" logo, and use an RGB monitor, and a set of stereo speakers to showcase the Jaguar's capabilities.

We also have a large screen TV that we're using to highlight some of the newest titles, like Alien vs. Predator, and Tempest 2000.

We have a series of Lynx kiosks set up as well, showing off the new titles that are available for the Lynx.

We're pleased to have some exciting products on display in our booth at CES for both the Jaguar and the Lynx! For the Lynx, Telegames is showing Super Off Road, and Krazy Ace Miniature Golf. They have recently released Desert Strike for the Lynx as well.

Atari is showing Lynx Raiden, Eye of the Beholder, and Ninja Gaiden III.

Beyond Games is showing new titles as well, including Ultra Vortex.

I'll make sure that complete descriptions of the Lynx titles are made available online here within one week of today. I had expected to have the completed text files outlining the story lines of all the games by today, but it didn't reach me in time for the CO tonight. (Sorry!)

<BOB-BRODIE> On the Jaguar side of things, Alien vs. Predator is coming along very nicely, and is a *HUGE* hit here at the show. This game is a 3D rendered tunnel/maze game with texture mapped walls, and striking digitized renderings of the Alien and the Predator creatures. As you play the game, you have the option of being the Alien, the Predator, or the Colonial Marine. Each character has their own set of unique skills, and weapons!!

Telegames is showing a preliminary version of Brutal Sports Football. Anything goes in this football game, THERE ARE NO RULES! Just pick up the ball and run for your life!! Players compete on the gridiron against 16 of the most unforgiving mutant teams ever to separate a cyborg from his generator pack!

Telegames also announced that they would be producing European Soccer Challenge for the Jaguar. This title will be a significantly enhanced version of the same title currently available on

the Lynx. In addition to true color graphics, the product will have an expanded season and playoff format for the 170 teams. A specific personality and performance ability will be established for each players, and you can earn the ability to trade players under certain circumstances.

Ultimate Brain Games is an expanded version of the Ultimate Chess Challenge title for the Lynx as well. In addition to a chess game, there will be a backgammon and checkers game. This product will features specific game set up for computer solution, and digitized graphics.

<BOB-BRODIE> Atari is showing an early version of Checkered Flag II for the Jaguar, featuring real time 3D generated action. The player is allowed to customize racing cars to his wishes. The cars, buildings, and roads are rendered in real time 3D. (No *RAILS* like Crash N Burn and Total Eclipse!!!) Racing speed is intensified by 100 percent true sound effects, crashes feature realistic sounds and imagery with parts flying, and tires screeching.

Tempest 2000 is one of the most popular games in arcade history, back in it's original form as well as in three new versions. On one cartridge, you get four games! Tempest (original version), Tempest Plus, Tempest 2000, and Tempest Dual! The games feature two player cooperative play, the use of an android, cycle shaded webs, and many new weapons and challenging bonus levels.

<BOB-BRODIE> All told, there are over 15 new titles that have been announced at the show for the Jaguar!! Among those are: Battlewheels, Car Wards, Commando, DOOM, Dungeon Depths, Evidence, Hosenose and Booger, Return to Zork, and Ultra Vortex.

Atari is continuing its roll out of the Jaguar on a national basis, effective immediately. All of the partners that we have been working with in New York and San Francisco that are national accounts, like Toys R Us, Babbages, and Electronic Boutique, will go national immediately. We will then roll out to the top ten markets in the US throughout the first quarter. Beginning in the second quarter, we will go to the top twenty markets. Our retail partners are pleased with our promotional efforts to date, and we have aggressive marketing plans scheduled up through June of this year that we have committed to.

To find out more about the anon service, send mail to help@anon.penet.fi.
Due to the double-blind, any mail replies to this message will be anonymized,
and an anonymous id will be allocated automatically. You have been warned.
Please report any problems, inappropriate use etc. to admin@anon.penet.fi.

49. 1.4 ROMs and Beetle mice needed

>I've thought about them plenty - The Jaguar has all it needs to be a
>multimedia machine, just beacuse it does not come standard with a
>CD-ROM is no reason to say it is not a good multimedia machine.

oh yeah, what sort of Multimedia software do you see becoming
aviable for a standard, cartridge based Jaguar? Encyclopaedias,
Medical References, Digital videos? The Jagaur as it stands is a
GAMES CONSOLE and this mutlimedia system logo is just an effort to
make it a bit more upmarket.

As for the 64-bit tag, there are some parts of the system that
are 64-bit, but its still misleading to tout the thing a a 64-bit
system. Just like Nintendo pushing the SNES as 16-bit. FYI, parts of
the AGA chipset have 64bit paths but nobody calls the Amiga a 64-bit
machine.

>Which is my point - I would not say the CD-32 is not a multimedia
>machine because it currently does not have such an interface. (Ok,
>that is a bit convoluted of an example).

Too right. But the Cd32 DOES have a mass storage device, the
CDROM! I like the idea of interfacing with cable TV to get data
though. Sort of like a graphical version of the InterNet in your
living room. Whether consumers will go for this is pretty doubtful
though...

>CDI is making a good comeback - they have had a lot of TV ads latley
>and had good sales over christmas. It all comes down to advertising
>in the end. If the advertisers can show people why they shoukld want

>same way it did for VCR's.

CDi has been out for a couple of years now with neglible market
penetration. Phillips are spending loads but it still seems to be a
bit of a dead duck. The FMV option might persuade people to buy the
players to view videodisks (on 5" CD that is), especially if FMV
comes as standard and their is a carousel system for multi-disk
films. As a games console/multimedia system, well the software
available is quite frankly laughable and thats what counts as
experience shows that software sells hardware.

>All the Jaguar is missing is the CD-ROM, and it will be out in time -
>there are already games under development for it, so it is a reality.

What about the Atari Panther then? Did that ever see the light of day? There were games in development for it too...

I believe there will be a CDROM drive for the Jaguar, but time will tell when we see it and how well its supported.

>> Its fair to say that a CD based jaguar WILL be accepted as a
>>multimedia platform by anyones standards, and will certainly offer
>>more power at this than the CD32 could.

>Ok, that was all I was looking for.

Maybe you should take time to analyse the picture rather than blindly advocating Atari.
Obviously only a FOOL would attempt to say the CD32 had better hardware, but thats not all there is to a good machine. I have a strange feeling that Sega or Nintendo will end up with the Lions share of the market, regardless of what Atari or CBM do.

That's right - I bought a GAMES console. And I do see multimedia
GAMES being developed for the coming Jaguar CD-ROM. Incidentally,
wheer are these titles you mentioned for the CD-32? I have heard
nothing about any under development... I don't think that is so bad,
as the CD-32 is also a game console.

If I wan't encyclopedias, I'll get them for my computer, thanks.

The whole TOM chip and internals are 64 bits. The whole machine has a
64-bit bus. The Jaguar is a 64-bit machine, no hype about it.

>though...
>

Yep, I'm not too sure they will eaither, but I rather like the idea
myself... The jaguar will have a CD-ROM in the future, and stuff is
under development for it.

The cable multimedia stuff is what I believe the MPEG-2 cart is about
(probably all systems will have them), it lets you transmit a goodly
amount of digital video over cable lines.

>>CDI is making a good comeback - they have had a lot of TV ads latley

I think that CDI had very respectable sales over the holidays.
However, I too think CDI is a falling star - I predict FMV CD-ROM
disks to be a major flop, probably taking the CDI with it.

I am not "blindly" advocating Atari. Perhaps you should open your eyes to a few truths about the Jaguar. Please point out where I am using baseless claims to "blindly" advocate the Jaguar.

I bought a Jaguar because I like the current games, see better games on the way, and recognise that Atari really means business with this machine - TV ads and real distributors (like I can now go to just about any mall in America and get Jaguar stuff).

Possibly - Sega might be able to maintain good market share if they really get the new machine out on schedule. Nintendo has major problems, and are running around like a chicken with its head cut off.

Hmmm, if the ATARI Jaguar -does- get enough market penetration, this
would be a -very- viable product; put the indexing info on a cart,
and then issue yearly updates on CDs... Hmmm, the Jaguar Reference
Set... Sounds do-able to me, especially with their (10) keypad.

I like debate. And this whole newsgroup would be very boring if
we all agreed on the same thing. On the 64-bit tag thingy, I have to
say something.

Most computers today are not true 32-bit or true 16-bit. The Atari
and Amiga computers have had 8-bit data paths and 8-bit processors.
Take for example the keyboard chip. Yet there are still called
16-bit micros (ST and AMIGA). The main chip is the 68000 and
that is internally a 32-bit processor.

The reason there are called 16-bit? It is beause the vast majority
of work done in the computers is in 16-bits. Simple fact.

With the Jaguar or any other system, it is fair play to state the
the machine is xx-bit if the majority of work is done in xx-bits.
That is true of the Jaguar. Most data is moved and operated on in
64-bits. Simple fact.

The AGA chips in the amiga might have some 64-bit registers (?)
but the larger part of work is done over a 32-bit bus and operations
inside 32-bit processors.

The world is not black and white.

>>> Its fair to say that a CD based jaguar WILL be accepted as a

Well, it seems a lot of you have specs problems. The Jag is not limited to just a 10-key keypad. Atari's whole intent was to keep the system going for as long as possible by making it very flexable. Here are the confirmed specs:

64-BIT RISC-Based architecture with multi-processor array.

Data path runs at 106.4Mbyte/sec using 64-bit pathway.

Individual inter-system graphics processor running at 27 MIPs with an internal 4K of zero wait-state SRAM equiped to do full range graphical effects including high-level, very high speed rotations, shading, morphing and has a programmable infrastructure so programmers can be more flexable in what they want to do, they don't have to conform to specific guidelines set by Atari for the graphics they want, they can basically change the way the Jag makes graphics depending on what they want it to do.

Another processor, an Object Processor, basically works with the graphics processor to enhance visual effects, etc. Can handle Sprite animation, pixel-maps, and character maps as well as a full range of other high-performace features.

Another processor, the Digital Signal processor, running at 27 MIPs with the usual 8K SRAM puts out CD Quality audio and full stereo and because it is indivdual it does not interfere with the fast work going on elsewhere in the system.

They have a Blitter that takes on full Logical Operations at high-speed like Z-Buffering and Gouraud shading.

Yet another processor, this time MC68000 class CPU, acting as a general purpose control processor, basically monitors and manages the action processors.

32-bit color system, putting out 16,777,216 colors updating at 850 million pixels per second. System is Full-3D Ready.

ROM Reader/Cartridge and Interface takes 48 megabits of uncompressed data. They can compress really big games and this goes to a max of 400 megabits.

Uses 16 Megabits of "hyper-speed" page-mode DRAM.

An optional double speed CD-ROM Drive.

ComLynx I/O for networking to other multi-console games. Interfacing system on all COMM units allows attachment to modems, digital optical data networks, as well as basically anything else that shows up later. It is very flexable in this area. It willl support analog interfaces too,

along with keyboards, lightguns and mice. I doubt disk drives would even be a problem here.

Controller pad is kind of big, uses 3 fire buttons, pause, option, and a 12-key control keyboard with game-specific control/overlay options. So you won't have to use the same buttons for different moves in MKII as you do in MKI Sega/Genesis now.

It also has a high-speed synchronous serial data port, this works in conjuntion with the Cable-TV Networks, interactive games and other digital systems. Eventually if they ever get this data superhighway installed you could probably hook your Jag to it and play MKII with another player in a different state.

This system, with CD-ROM or digital optical interface no doubt at all can become a complete multi-media system. It can have keyboards, mice, "touch screen" systems, anything Atari or 3rd party hardware dudes think of. All they have to do is make the data interchange compatible with the Jag's HIGHLY flexable interfaces and you can basically add anything you want. You can network it to your PC, your TV, your phone, call other Jag's and play your best friend miles away using a modem, and a lot more. If you don't like the Jag, don't get it. I could care less. But I think your going to miss out on more than you think.

Shawn

but you have been arguing that the standard (CD-less) Jaguar IS a
multimedia system!!!!! You at last admit that the cartridge
Jaguar is only a games system and NOT a multimedia system as Atari
are hyping all over the packaging?

There are loads of old CDTV multimedia titles available that run
on the CD32. Things like the Grolier Encyclopedia, Dr Wellman,
Golden Age of Spaceflight etc. These ARE multimedia titles. I dont
know much about whats in development, but Id say that developers are
most unlikely to make MULTIMEDIA systems based around a cartridge
Jaguar. Comprende?

>The cable multimedia stuff is what I believe the MPEG-2 cart is about
>(probably all systems will have them), it lets you transmit a goodly
>amount of digital video over cable lines.

Yes, this looks like it could be good. Digital TV transmission is
the way to go, and if its interactive then all the better. I don`t
know if the technology has matured yet, if anything it could be
another 3-4 years before there is a demand for this sort of system.

>I think that CDI had very respectable sales over the holidays.
>However, I too think CDI is a falling star - I predict FMV CD-ROM
>disks to be a major flop, probably taking the CDI with it.

Come off it! CDi has flopped from the start. However, Digital
Video could take off. The CD32, 3DO, CDi and Jaguar-CD (when it
arrives) will all be able to play these digital videos off CD
(albeit with add-on cartridge). This could create a new standard for
video distribution. The market is ready for a read-only, compact way
of delivering good quality video and sound. Dont forget that you
will be able to add an MPEG decoder to any CD player with a digital
output too! (and lets not forget DAT - with 2hr playing time and

tiny cassettes this could be the ULTIMATE MPEG delivery format!!).

>I am not "blindly" advocating Atari. Perhaps you should open your
>eyes to a few truths about the Jaguar. Please point out where I am
>using baseless claims to "blindly" advocate the Jaguar.

Your constant claims about coming games, hyping the system as if it going to be THE system etc. It might be true, but just take a look at Ataris past record .....

The 8-bits, 400/800/XL/XE. Excellent machines, poor marketting and developement. As a result, they died out without ever realising their potential. What a waste! Different management then though..

The ST. Bit of a poor machine, did well until the Amiga trashed it. Only heavy marketting and promotion could have saved it, so I guess we can`t blame Atari, even though they did screw up the marketting etc.

The Lynx. Awesome handheld, state-of-the-art. Still the absolute best handheld bar none. Very poor choice of software vs Sega or Nintendo though, and poor sales. Most people wouldnt even consider buying one at the present time. Again , Atari totally screwed up promotion and software support.

The Falcon. Nice DSP, but shared the ST image. A virtual total lack of advertising and promotion from Atari meant it never took off. The fact that you can only get it in a 68030 16Mhz config, with no 040 in sight and no proper Box or Tower system with multiple slots (officially that is) shows how little development they have put into it. It really has flopped commercially, even if it has lots of satisfied owners.

Both the Lynx and the Falcon were good products. Both had massive potential. Both were ineptly marketted by Atari and flopped as a direct result of Ataris incompetance. I bet when they first appeared you were advocating them like you are advocating the Jaguar right now. You pointed at the price, specs and software in development and said the sort of things you are saying now about the Jaguar (probably).

yeah, you MIGHT be right this time but most of your advocacy is based on blind optimism, not previous experience of Atari policy and management. What has changed about Atari in the past ten years? Do they have an all-new lineup and strategy? What reasons have you to say that they will succeed this time where they have screwed up at least twice before? Lets see a NEW reason why the Jaguar will be a success. Not superior hardware, as Atari had that with the Lynx, not price, as Atari are selling the lynx very cheaply.

>Possibly - Sega might be able to maintain good market share if they
>really get the new machine out on schedule. Nintendo has major
>problems, and are running around like a chicken with its head cut

>off.

Please! Nintendo and Sega single handedly CREATED todays
videogame market after Atari let it slip away from them in the
mid-eighties. Now Atari are going to wipe them out, like they did
with the lynx and Falcon?

maybe you havent been reading the thread. The arguement was
about Atari branding the standard, CARTRIDGE (cd-less) Jaguar as
being a multimedia machine. It obviously isnt. They could issue
updates on CDs, but I doubt that many owners of the base machine
would be able to use them.

Gavan:

Atari specifically took a new approach this time. Their Public Relations and marketing is being run by Bohbot Communications to insure success there, and they manufactured it at an IBM facility. They also used a star design team and spared no cost to make it good. Atari has quite a vast amount of cash ready to go at this time, they are not in debt but quite the opposite. So now they want to make a big show out of it, and I don't think with all their co-ventures they will let Jag die. They realized their mistake in the 80's and have corrected the problem. You are judging them on what they WERE like, not what they are.

I hear Bohbot and Atari have made some very interesting "tease" commercials and I am waiting for them to air....

So give Atari a chance.

63. 64 bit or not?

Take the keyboard for example.

If you can say that because of your typing speed that you need a 64 bit pathway for your keyboard I think you should be training for the Olympics.

You could market yourself...

Have your own line of athletic wear...

the possibilities are endless!!

Forgive me...I only lurked for about 5 minutes.

Another view:

It is possible to make the Jag output effective video and audio to compare to multimedia without the CD-ROM Drive. The cart's support up to 400 megs of data. You can fit a lot there. Also, everyone here is still stuck on physical information sources. Your forgetting that that is becoming outdated. Where I live we are supposed to have digital, interactive services in our houses by the end of next year. In our TVs, Phones, everything. The Jag can link to this and begin pulling UNLIMITED resources. The only storage concern continuing is how much can the servers on the network support, and that ends the thread. The Jag is ready-made with resources to link to this and many more "futureistic" information services. Multimedia using CD-ROM will soon be more outdated than the Atari 2600.

65. Re: 64 bit or not?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-01-13 01:55:22 UTC
From: shawnspo@csn.org
Message-ID: <CJJpCB.Hn1@csn.org>
Source record: 19316

The 64 bit structuring is for the intensive, super high speed updating occuring inside the Jaguar. The MC68000 CPU will be only 16-bit, but it does very little in a Jag. It watches "Tom And Jerry" (the code name for the chip structure), makes "management" functions, etc. Nothing much. However, when you get tom&jerry bouncing 850 million graphics instruction per second off to its internal systems, you need a 64-bit data pathway. Not to mention audio instruction, human interactivity, effective problem solving, internal system monitoring, etc. You don't need 5 processors to use a keyboard either, the Jag does and it couldn't give a damn about a keyboard.

In every logical, collective sense, it is 64 bit. You probably have 8-bit cards and systems in your computer. That doesn't make you computer 8-bit. It merely is using that to interface with something that requires no more. Sure, the Jag has some 16-bit systems, but its action processors blow 16-bit away so badly its practically immeasureable. People that don't think about it see 16-bit and flip and think well, its 16 bit then. WAY WRONG!

66. Jaguar Specs

Newsgroup: comp.sys.atari.advocacy

Hmm, well I rang Atari Australia HQ the other day and the guy on the phone was quite vague. He informed me Atari were not expecting shipments until May at the very earliest. He explained to me that they were told by America that more details would be worked out by the end of January, to which he added "Which probably means more like mid-February"....I sympathised with him.

Furthermore he told me that he had no idea what it would cost. I suggested the above $425 as a figure, but he replied "I really can't say". Looks like it might be a while after all, the only comfort I can gain from this is that by the time the Jag does get here the teething problems will, hopefully, have been sorted out.

>are hyping all over the packaging?

Nope, because Multimedia is so poorly defined - you could have all of
the elements of Multimedia from a cart, you just would'nt get much
from them. Also, you could buy stuff like a cart that hooks up to a
network, hook it up, and voila, you have mulitmedia.

>
> There are loads of old CDTV multimedia titles available that run

>Jaguar. Comprende?
>

I see your point, but "mutimedia" is not as well defined as you would
like it to be. These kinds of things can't be done in a jag out of
the box without CD, but then again the Jag is a lot cheaper that way -
and few people really buy systems because they can use them for
"multmedia" anyway.

>>The cable multimedia stuff is what I believe the MPEG-2 cart is about

At least... though it may come sooner to some areas than others. The
trick is to live in a test market somewhere.

>

CDI has not really flopped - they have in the past, but are making a
real comeback - a large amount of advertising, and wide displays in
the stores.

I really think the Video CD will and should die - who will pay
$200-$200 for a cart that just plays movies that look as good as the
'ol VCR? I can get a damn nice VCR for that much, and can record
stuff too. I would say it might have a chance if LaserDisks were not
already on the market - they have a huge lead in number of titles, and
also offer a much superiour sound + video experience.

>

Yes, I think the Jaguar and the 3DO will be the coming systems - they
have the power to really produce games that are superiour to PC
games.

> The 8-bits, 400/800/XL/XE. Excellent machines, poor marketting
>and developement. As a result, they died out without ever realising

>their potential. What a waste! Different management then though..
>

BUT - the Jaguar has neither of these problems - good marketing, good developers, excellent distribution. For the first time, I can go into a real store, ask for the Jaguar, and they actually will have HEARD of it!

>price, as Atari are selling the lynx very cheaply.
>

NO - my advocacy is not based on blind admiration - they DO have a new strategy. What has changed? What has changed? How about Atari courting developers instead of telling them to fu*k off. How about TV ads for the Jaguar. How about national media press coverage of the Jaguar. How about real distributors for the Jaguar. How about many Jaguar developers that say they cannot get enough of the Jaguar. How about Promises kept for all release dates. How about EXCELLENT handling of the bad RF box problem - new Radio Shack Autoswitching RF boxes in all new units + exchange bad RF box for new composite or S-video Cable. How about a major presence at the CES for the Jaguar. How about non-atari people hearing the Atari name for the first time in years.

I did not buy a Jaguar myself until it looked as if they had really made an effort to correct past probklems, and it looks like they finally have.

You have to, at some point, admit that SOMETHING is different at Atari.

>>Possibly - Sega might be able to maintain good market share if they

>with the lynx and Falcon?
>

It is a mistake of the highest order to compare thier computer efforts
with those of the Jaguar. In the video game market, Atari can talk
the talk, and walk the walk - they can dance with the best of them.

Not that I'm saying they can scrath Sega. Nintendo will die anyway
(no mater what happens to the Jaguar or any other system). Sega will
probably hold on to current market share with release of new system
(also to be cart+CD based... hmm, does THAT say anything?)

Even with all my communication with Atari's Public relations "Monkey-boys" over at Bohbot Communications and talk with Atari Corp. directly I have yet been unable to get direct answers to the following two questions:

a.) Will JaguarCD be ready and released when the rest of Jag going nationwide, public release at the end of this month?

b.) Does the Jag have aux. audio outputs? I already have my home theater system "plugged" for the Jag's arrival with the video on the big-screen and the audio on the Sony Dolby-Surround system, but I need to know if I have to splice the audio from the Jag's output myself or does it already have audio jacks on the back?

Shawn

It does, but you have to buy a seperate cable. They currently have a
composite cable with stereo output for $20. They will have (have?)
s-video cables for about the same price, that also have stereo out.
The base units comes with just RF out (though making your own cable is
actually pretty easy).

Not standard, but the A/V cables are $20 and are available.

A. Bob Brodie said that release of the Jag CD will be in June (from last conference on GEnie).

B. Right, Atari has the composite cable for sale, it can be ordered directly from them. They will also release the S-Video version but will not release a RGB version although the Jag supports RGB. I had one made by a friend on GEnie.

|> the hardware specs because they sounded too good to be true... but we all
|> know they ARE true.

Hmmmm.... the Jaguar certainly has good specs, but there are things
still that look just too good like the 850million pix/sec (which is 1-bit
with 0 bus contention), the '64-bits' power-> still kind of 'in the air'.

We'll have to take a look at that RISC.... why ATARI would put a
68000 @ 13.5Mhz (was it 13.5Mhz?) just to read joysticks? Doesn't make
much sense.

Still, yes, the Jaguar looks impressive. Just don't blame Popular
Science for being skeptics about a company with a track record of
pure hype and no good products since a long time.

|> I'm sure once the Jaguar gets into national distribution,]

81. Jaguar status....

Newsgroup: comp.sys.atari.advocacy
Date: 1994-01-17 20:12:32 UTC
From: mefisto@rmece02.upr.clu.edu
Message-ID: <1994Jan17.201232.83523@rmece02.upr.clu.edu>
Source record: 19332

Well, by reading some magazine reviews I see:

* Jaguar needs better software support. Early games
most people/magazines say 'don't show the 64-bits of power' that
the Jaguar is supposed to have

* Needs more games (understandable)

My guess is that unless ATARI comes out with good titles soon, the
Jaguar - success will be delayed by at least 6 months.

3DO seems to finally be coming out with a lot of titles, but
it is still so $EXPENSIVE$ that I don't see how it will sell.

Actually, they put the 68000 in the system at the last minute at the
insistance of the developer. It theirs mainly as a tool for developers to
get use to the Jaguar hardware. Most developers are fairly experienced
with the 68K. You can look at it as a stepping off stone for developers.
Once they become more familiar with the hardware, they will rely less and
less on the 68K. Rumour mill has it that 80% of the code for the initial
games run off the 68K.

Wrong!!!!! You have it ass backwards, Atari comes out with great products
with lousy pr. I would take most atari products over any other system if
they would have promoted them better. Unfortunately, great hardward is
useless without software.

Well, here's the thing: if the Jaguar RISC is very tuned for graphic
operations, then it will be wiser to use the 68000 as the CPU. Now,
I am not turning down the power of the Jaguar. If all the 68000 has to do
is calculate some 'if' logic and let the RISC do the graphics, that is
still very powerfull indeed.

Don't give me the 'you have it ass backwards.' I was an ATARIAN since 1980, and I know that ATARI (particularly when acquired by Tramiel) hasn't really come out with good products except when the ST came out the very first time, when it was very price competitive.

The Falcon is a good machine, for music, not as a general purpose machine which shows why the sales are so abysmall.

The Jaguar looks like the very first good product that ATARI has done in while..., well, ok, I'll add the Lynx to that.

Hmm ... what else?

1) The Lynx ... most powerful handheld on the Market
2) The Atari 7800 ... only 8-bit game system with flicker-free animation
3) The Atari Portfolio ... first Palmtop to sell for a reasonable price
4) The Atari XEGS ... game system that could be tranformed into a
computer with many uses later on.

These sound like pretty good products to me!

Yep, that's mainly the intent - graphics go to TOM, sound goes to
JERRY, and data structure stuff goes to the 68000. A pretty good
arrangment, I'd say.

The Falcon is a great all-purpose machine, and competes well against MS-DOS boxes well in this - except that it is a bit expensive. The reason the Falcon sales have been so very abysmall is because they had zero advertising for the Falcon, and with the strange Atari dealer plan, it is very hard to actually get a Jaguar - I wanted one badly, but it took me four months to find a dealer who could sell me one!!

> The Jaguar looks like the very first good product that ATARI has done

And the Falcon. You just have to use one to appreciate it.

Help, me oh lord did I miss anything last few days ???

How did the clairvoyant manage to do this ??

How do you get your message to nearly all groups ??

So far pray the lord to void such people from acces to the net in future !

Amen !!

And the lord told me that I shall go forth and teach his word
by blowing off the net-resources.
And I took my machine and did it.

(would be the vision of that special friend of us)

Hope he gets a similar annoyence to his favorite groups !!!!
(No ! Me non preferar la vendetta !! ;->)

last line sort of spanish (not real just some try to) :-)

What is going on with the JAGUAR ? IS THERE a JAGUAR Newsgroup, or FTP site yet, for developers or otherwise ?

What are the best games for JAGUAR ?

Who are the big developers for it ?

Where can I buy Kasumi Ninja ?

How does it compare with Mortal Combat and Street Fighter ?

Are there any Head Mounted Displays or other VR peripherals out there for the JAG ?

Thanks,

GAME.MASTER@TeamInfinity.com

This came from the mouth of the developer. He posted a message on
Compuserve to this fact....I'll see if I can get his comments and repost
them here.

Plenty is going on. There are over 50 developers and about 57 games announced for it.

|> What are the best games for JAGUAR ?
There's only 4 out at the moment. More soon. Aliens V predetor is the hot one. Due April AFAIK.

|> Who are the big developers for it ?
Plenty of them. See the FAQ. There was also a list posted somewhere recently.

|> Where can I buy Kasumi Ninja ?
Not out yet.

|> How does it compare with Mortal Combat and Street Fighter ?
Mortal Kombat is an announced game for the Jag.

|> Are there any Head Mounted Displays or other VR peripherals out
|> there for the JAG ?
Not *yet*.

Try and get a copy of the Jag FAQ which answers many of your questions. Also check out rec.games.video.atari and rec.games.video.misc for jag chatter/abuse.

This is captured from AEO magazine (which was captured from John
Mathieson's post on CIS

John Mathieson <CIS: 100111,2631> - one of the designers of the
Jaguar - speaks with authority on Jaguar hardware:

From my limited understanding of the 3D0 hardware, I believe that
Jaguar out-performs it by a factor of two, broadly speaking. Of
course, both systems have their strengths and weaknesses, but I
believe Jaguar is much better suited to 3D animation compared to
3D0. Also, we (Atari) publish the full hardware specification (to

signed-up developers), whereas 3DO force you through an OS. Games programmers tend to want direct access to the hardware and full control of the system.

Jaguar can produce an interlaced display with 720 pixels across readily. In fact, the maximum resolution horizontally is around 1350 pixels, although you have to do some tricks to have more than 720 pixels horizontally.

As one of the Jaguar designers, I thought you might like to know why there is a 68K in Jaguar. (I did the GPU & DSP, and the blitter). In one of our cost reduction drives, we seriously considered no CPU, however I vigorously opposed this as the GPU and DSP are unfamiliar to programmers, were never meant for overall system control, and are only really fast out of their relatively small internal RAM blocks. The principle is that you get your RISC processor to do all the intensive but fairly simple low level parts of a 3D game, and you get a CISC processor to handle the high level, complex, but fairly un-intensive parts - e.g. game-play, view point control, collision detection, etc. Those complex addressing modes are great for rattling round structures. Its also important to have a manager in a multi-processor system, and the 68K performs this task well.

Because the GPU and the DSP both out-perform the 68K so significantly, I joked that the 68K was "only there to read the joysticks". This joke seems to have spread a little far, so lets kill it now.

The answer to Jaguar's bus width is that it is 64 bits where it needs to be. The two highest data rate paths, which are those between the RAM and the object processor (display generator), and that between the blitter and RAM, are truly 64 bits. The blitter can generate Gouraud shaded pixels as fast as the DRAM can run in page mode (13 MHz for us), so it can do 52 Mpixels per second in Gouraud shaded 16 bit pixel mode. The display generator can load pixels into its internal buffers as fast as the RAM can supply it.

The RISC processors manipulate 32 bit data as this is all the precision they need. They have 32 bit ALUs and 32 bit address generators. They can perform 64 bit transfers on the main bus if they need to, but not many data are this big. The graphics processor uses the blitter as a co-processor when it really needs to blast pixels. The instruction size is 16 bits as this allows a reasonable number of instructions plus two register/data fields in each instruction.

The name of the game is bus saturation, if you can keep a 64 bit bus fully utilised, then your processing elements are as fast as they need to be. Well written Jaguar code can get close to this - you ain't seen nothing yet.

By the way, the first time I saw Alien Versus Predator I did not believe Jaguar could do that. I look forward to many similar surprises.

I read that Mortal Kombat II takes exactly 6 megs of ROM (megabytes)
or 48 megabits ;-)

If ATARI could do this game *IDENTICAL* in everything to the arcade,
even if they charge, say $100, it would sell.

I believe the Jaguar could do it.

No doubt about it. The Jaguar is by far more powerful than the computers
in those systems you see in the arcade. Thing is, the Jag is more
conventional. But, the Jaguar is not even intimidated by the demands of
MKII.

Shawn

Dateline Atari! with Bob Brodie

Live from Las Vegas
Winter Consumer Electronics Show

Friday, Jan. 7th, 1994

Host - Lou Rocha

<[HoST] ST.LOU> We have a lot of newcomers here tonight that I would
like to welcome. When you use the /RAI command to call me it will take
me a few minutes to acknowledge you. Please don't /RAI more than once.
It pollutes my screen

Also please use the /nam command so I know who you are. For example /nam
HoST gives me the HoST that you see. Please use a short nickname
tonight. Please :-)

<[HoST] ST.LOU> Welcome to our first Dateline Atari of 1994! Tonight is
the last evening of the Winter Consumer Electronics Show and Atari has
been in Las Vegas showcasing the Jaguar. We expect to hear a report on
the week's events from Bob Brodie, Director of Communications.

Bob has been real busy this week so we really appreciate the extra
effort in joining us tonight. Having done Comdex this year myself, I
know what an exhausting week Bob must have had. Thanks for joining us
on GEnie, Bob!

The last few weeks have seen the posting of various Jaguar developer lists in the Bulletin Board. Elsewhere ATC stock is starting to inch up again. Some of our recently enriched observers are speculating on a new high of 30.00! Time will tell.

There has also been some recent chatter about new production runs for the TT - Atari's workhorse workstation. Rumours also abound about a 68040 computer being developed by a third party European company. Are these "visions of sugarplums" or post-holiday bonuses? Why don't you join us and we'll ask Bob. Bob, the floor is all yours. Please GA

Happy New Year, to all of our friends on GEnie! I trust
that you have all enjoyed the holiday season very much. Activity at Atari is at an all time high as we continue with the our release of the Jaguar.

For the third month in a row, this session of Dateline: Atari is coming to you from the road! In November, you may recall that we came to you live from the New York City Launch event, in December I was back in New York visiting with retailers. This month, I come to you live from the Consumer Electronic Show in Las Vegas.

Today's session concluded about an hour ago, and I've rushed back from the show floor to my hotel room to join you online tonight. We have lots of exciting news to share with you, so let's get started right away!!!

The Jaguar can truly be called an award winning product!! Atari was presented with a number of awards so far here at CES.

Die Hard Game Fan Magazine has presented Atari with two awards, one for Cybermorph as "December Game of the Month", and another for Jaguar as the Best New Product of 1993. Video Game Magazine presented Atari with an award for Best New Product of 1993, and Best Print Ad of 1993 for the Jaguar.

Game Informer Magazine announced at their 2nd Annual Game Informer Magazine Awards that they have awarded the Atari Jaguar the Best New Product of the Year award!! Today, Electronic Games told us that they were naming Tempest 2000 on the Atari Jaguar the award as Best Game of CES! We're very excited and pleased with all of the accolades that the Jaguar has earned to date!!

Atari has returned to the main floor of CES. Our booth is located in Pavilion A, rather than using a suite as we have in the past few years. The amount of activity in the booth has been just incredible. We have visited by retailers from all over the world, and many prominent members of the media as well.

Today we hosted CNN for coverage of the exciting Jaguar title "Alien vs. Predator". We're displaying Jaguars in our booth in the interactive display kiosks that will be available for retailers to utilized. These kiosks feature the striking Jaguar "cat eye" logo, and use an RGB monitor, and a set of stereo speakers to showcase the Jaguar's

capabilities.

We also have a large screen TV that we're using to highlight some of the newest titles, like Alien vs. Predator, and Tempest 2000. We have a series of Lynx kiosks set up as well, showing off the new titles that are available for the Lynx.

We're pleased to have some exciting products on display in our booth at CES for both the Jaguar and the Lynx! For the Lynx, Telegames is showing Super Off Road, and Krazy Ace Miniature Golf. They have recently released Desert Strike for the Lynx as well. Atari is showing Lynx Raiden, Eye of the Beholder, and Ninja Gaiden III. Beyond Games is showing new titles as well, including Ultra Vortex. I'll make sure that complete descriptions of the Lynx titles are made available online here within one week of today. I had expected to have the completed text files outlining the story lines of all the games by today, but it didn't reach me in time for the CO tonight. (Sorry!)

On the Jaguar side of things, Alien vs. Predator is coming along very nicely, and is a huge hit here at the show. This game is a 3D rendered tunnel/maze game with texture mapped walls, and striking digitized renderings of the Alien and the Predator creatures. As you play the game, you have the option of being the Alien, the Predator, or the Colonial Marine. Each character has their own set of unique skills, and weapons!!

Telegames is showing a preliminary version of Brutal Sports Football. Anything goes in this football game, THERE ARE NO RULES! Just pick up the ball and run for your life!! Players compete on the gridiron against 16 of the most unforgiving mutant teams ever to separate a cyborg from his generator pack! Telegames announced that they would be producing European Soccer Challenge for the Jaguar. This title will be a significantly enhanced version of the same title currently available on the Lynx.

In addition to true color graphics, the product will have an expanded season and playoff format for the 170 teams. A specific personality and performance ability will be established for each players, and you can earn the ability to trade payers under certain circumstances. Ultimate Brain Games is an expanded version of the Ultimate Chess Challenge title for the Lynx as well. In addition to a chess game, there will be a backgammon and checkers game. This product will features specific game set up for computer solution, and digitized graphics.

Atari is showing an early version of Checkered Flag II for the Jaguar, featuring real time 3D generated action. The player is allowed to customize racing cars to his wishes. The cars, buildings, and roads are rendered in real time 3D. Racing speed is intensified by 100 percent true sound effects, crashes feature realistic sounds and imagery with parts flying, and tires screeching.

Tempest 2000 is one of the most popular games in arcade history, back in it's original form as well as in three new versions. On one cartridge, you get four games! Tempest (original version), Tempest Plus, Tempest 2000, and Tempest Dual! The games feature two player cooperative play, the use of an android, cycle shaded webs, and many new weapons and challenging bonus levels.

All told, there are over 15 new titles that have been announced at the show for the Jaguar!! Among those are: Battlewheels, Car Wards, Commando, Doom, Dungeon Depths, Evidence, Hosenose and Booger, Return to Zork, and Ultra Vortex.

Atari is continuing it's roll out of the Jaguar on a national basis, effective immediately. All of the partners that we have been working with in New York and San Francisco that are national accounts, like Toys R Us, Babbages, and Electronic Boutique, will go national immediately. We will then roll out to the top ten markets in the US throughout the first quarter. Beginning in the second quarter, we will go to the top twenty markets. Our retail partners are pleased with our promotional efforts to date, and we have agressive marketing plans scheduled up through June of this year that we have committed to.

I'm sure I could go on for quite awhile longer, but seeing as how we're getting started a bit late tonight, I think this probably is a good point to open the floor to any questions, Lou.

<[HoST] ST.LOU> OK, Bob. Lots of people are waiting and we have lots of newcomers. Folks, remember, only /RAI once. First we have M.BALDEON

<[SWiTCHB0ARD] M.BALDEON> Any new developers (CAPCON, or ACCLAIM?)? Any new CD ROM info... I don't think lack of software supports is a good reason to delay it.

<[HoST] ST.LOU> BTW, I can only allow one question in the first round.

Yes, there are a number of new developers that are coming on board. We are having meetings with Capcom here at the show. Re the CD Rom, the hardware is quite close, and will be available in June.

<[HoST] ST.LOU> Any ideas on the price for CD, Bob?

BTW, one of the other titles that we're showing in the booth is Kasumi Ninja, a fighting game with graphic violence. The CD will go for approx $200, Lou.

<[Dave] D.SHORR> Atari has stated that the rendering speed of the Jaguar is over 850 Megapixels per second compared to 3DO's 64 Megapixels per second; is this a fair comparison given that Atari's pixel is represented by a single bit?

Of course it is.

<[NewSTar] C.S.SMETON> Bob, I have a question from a friend (Paul Plants) who does not have a GEnie node in his town. He wants to know how/if his Atari Explorer subscription will be filled out. Or is the

magazine gone forever?

Charles at this point we don't plan to bring Explorer back. Paul should contact our Customer Service Department and request a refund. We'll be happy to refund his money.

<[Chris] C.KROWCHUK1> Bob, congrats on success in 93. I am a retailer in Edmonton offering Atari peripherals & software. I would like to offer Jags & Falcs but am concerned about warranty. I have left messages and mail, no response. So, how about it, any plans?

On the Falcon side, there are no problems with the warranty at all. Our policy is quite clear on it, it has a one year warranty. Dealers are allowed to replace 6 components in the field; those are as follows: the keyboard, power supply, hard disk, floppy disk, ram board, and something else that I can't recall at the moment (sheepish grin) On the Jaguar side, we're not ready to sell to Canada yet. That will probably happen around June.

<[Ken] K.STEVENS1> Hi Bob, Got Raiden in yesterday and haven't been able to stop playing. Great implementation of the arcade game. Question, Sega and a couple other console developers have released some of the specs of their game systems. Most are due sometime around Christmas. From what they have release on the specs they are going to compete with and beyond the Jaguar. The question, is Atari working on the Jag II or a accesssory that will move the Jag to or beyond the specs of the new game consoles coming out?

Ken, I haven't personally seen those specs, but discussed them with our VP of Technology today. He agrees that the machines sound neat, but feels that they are going to be priced very high compared to the Jaguar. Do you recall the price they announced?

<[Ken] K.STEVENS1> Bob, to answer your question about price. About 500 dollars for the Sega Saturn (US dollars). This includes the CD (Quad Speed)) I personally think that they are biting off more than they can chew with the specs they have release at that price.

<[Mike Lipson] M.LIPSON> Hi Bob! Do you know if Atari plans on issuing more stock in 1994?

No I don't know the answer to that, Mike. Sorry.

<[HoST] ST.LOU> Lots of hands tonight, Bob. Next we have D.VANTREASE

<[SHADOW] D.VANTREASE> Will you post us a list of the national rollout city schedule? And what's the latest AvP or SVideo release dates?

I apologize for not having the national roll out press release at my side. I will see to it that the information gets put out ASAP. Look for the S Video cable the end of this month, and AvP around April.

<[ED] E.BAIZ> Is Atari going to make a case for the Jag similar to the one for the Lynx?

We're in discussion with a number of companies for accessories like that, Ed. I'm not sure if we will do it, or allow other companies to do them for us.

<[Ed & Mac] ERIDDLE> What was 3DO's reaction to the Jaguar being @ CES in FULL FORCE, What did they have to "combat" the Jags presence? Waiting for Aliens vs. Predator...

Trip Hawkins gave a presentation at CES. He addressed virtually every competitior EXCEPT Atari in his discussion of the market. When he opened up for questions, he was asked specifically about the Jaguar.

<[HoST] ST.LOU> Don't leave us hangin' Bob :-)

His response was that he didn't feel that the Jaguar competed against 3DO because 3DO isn't a Toy.

<[HoST] ST.LOU> Hahaha!

When it was pointed out to him that the Jaguar is outselling the 3DO by a factor of 10:1 according to some retailers, he said "...Go to the Atari booth and see it for yourself!" And hundreds of people did just that. :) We're grateful. On a slightly more serious note, I'm told that there are some impressive titles in the 3DO booth. However, the retailers claim that it simply isn't selling.

<[HoST] ST.LOU> Travis Guy from Atari Explorer Online is next!

<[Nat'l Champs] AEO.MAG> Hi Bob, it sounds like everything's going well.... Can you take a minute and give those of us who can't be there an anecdote or two that would help convey the reaction the Jaguar is receiving? (Aside from Trip's reaction! :) I'm interested in what Jaguar title seems to be generating the most intense interest.

We've been showing Alien vs Predator on the big screen, so it's getting the most interest. There have been a large number of people that have asked to purchase one on the show floor. We had a number of employees from Sega and Nintendo visiting the booth, and playing our games. They seem to be very impressed. Among the more interesting stories from my role in dealing with the media has been the many members of the Japanese press who have visited our booth, DEMANDING review units. :) Many of them were wearing Sega hats, too. :)

<[Sam] SAM-RAPP> I was gonna ask about the cheats for crescent Galaxy, but I thought I would ask if you have any new developers you can name specifically? Of course, You could always answer both! ;-)

Why don't I talk a little about the cheats, and we'll deal with the devs AFTER the show. We have some key appointments at the end of the week. Re the cheats for Cresecent Galaxy....When the Crescent Galaxy title comes up, press 1193. This will activate the cheat mode

for Crescent Galaxy. The codes are entered in from the second controller. For example, pressing the joypad to the right will make you scroll really quickly across the screen.

<[HoST] ST.LOU> Still 15 in the queue. If you are waiting, please have your question ready and wait for Talk-Mode before pressing [RETURN]. Next is B.DUNCAN.

<[BaltimoreBoy] B.DUNCAN12> Will There be a Virtual Reality Device for the Jag anytime soon?

There is one in the works, but I'm not sure how soon it will be available. We want to be sure it isn't a hokey device like some of the virual reality stuff.

<[Sir Fransis] K.DRAKE> All of the games until now are 16 meg and retail at $49.99. As the more visually impressive games will use larger meg sizes, will the prices get too close to becoming unbearable? (like the $99.99 price for Sega's VR racing).

I don't think so, Kenneth. We do have some developers talking about $89 games, but I haven't seen any real firm plans for them yet. Crescent Galaxy is really impressive graphically, and it isn't that expensive.

<[Graham] G.NORTON> Bob, I have a few questions for you. 1) We have been trying for while to get hold of either Shirley Taylor or yourself for a while and haven't been able to. Can you suggest a good time to call when we might be able to speak to someone...or is there such a thing? :) 2) Is Atari going to be addressing the dealer warranty program that had been canceled any time soon? It is very hard, especially in Canada, to be sending products down to Atari (or even Pacific Software) any time we have warranty work, and needless to say time consuming. 3) What is Atari planning for Canada with regard to dealers (getting more online), and with regard to both the Jaguar and Falcon? 4) Lastly, while I realize the Jaguar is Atari's central product right now, I hope the Falcon hasn't been forgotten. Atari needs to reduce pricing on the current Falcon and introduces faster machines just to stay current. As we all know in the computer industry, if you are not moving forward you are falling behind.

Graham, in fairness to everyone here I can only take one question tonight. Sorry. We have restored voice mail at Atari, and I had not received any messages from you in the last few weeks. Please call and leave your number for either Shirley or I and we'll call you back to discuss your concerns. Atari was closed between Christmas and New Years, but I was in the office during that time, and checked my voice mail daily. I don't recall any messages from you, although I am about 3 weeks behind in my GEnie mail at this point.

Hi Bob. Glad to see you here. Many Atari computer users, while glad that Atari is doing so well with the Jag, are feeling a little nervous. The "real" dealer network seems to be dwindling and

there are fewer and fewer 3rd party offerings. I guess the question is: is there a future for Atari computers other than just as a Music machine? Are we Atari computer enthusiasts going to be more orphaned than we are now?

We are still very much interested in the computer market, Mike. However, the reality is that at this point it time if we are to be profitable we must pursue the Jaguar. The fundamentals of the computer side of our business have changed, the most compelly products for the Falcon are largely music related products. It is our believe that the capabilities of the Jaguar are well suited for computers as well, and we are considering how to go about doing that in the best possible fashion. In any event, we will continue to service the needs of our computing customers to the best of our ability.

<[HoST] ST.LOU> Bob, can you shed any light on the production of TT's that was mentioned a few months ago? And what is 'compelly'?

a typo from lack of sleep, sorry.

<[HoST] ST.LOU> compelly=compelling?

The production of TTs _has_ resumed. What I have not been clear on
** disconnected.

<[HoST] ST.LOU> OH OH... Deja vu ... hang on folks. There are lots of people in the queue so I am closing it for now. If we move really quickly, I will take more /RAI later. No more /RAI for now. Thanks. Bob is back

<[HoST] ST.LOU> I just got a note that the cheat works. Sam is moving right along :-)

<[HoST] ST.LOU> Matt Rivman will be next, them M.MURPHY and Ringo Montfort

Sorry, gang. That's a new record, twice in one night. :)
Did he (Sam) think I would lie??? :) :)

<[HoST] ST.LOU> Matt, how about asking your question now?

<[Matt] M.RIVMAN1> Howdy Bob, and welcome. A while back, someone posted in the Jag topic that their local dealer sold 4 units to some Electronic Arts folks. Have they expressed any interest in writing for the cat to Atari, directly?

On an informal basis. Remember that Electronic Arts really doesn't write that much software themselves. They are largely a publisher of other people's products, like John Madden Football for instance.

<[Kid Metal] M.MURPHY31> Happy New Year, Bob, and congratulations on what sounds to be a successful CES. When can we expect to see Jag TV

ads go nationwide? Can you give us any details of specific ads we'll be seeing? Thanks.

We will be going in the top 15 teen shows in in the top ten markets in Feb, and March with the TV spots. There will be cable TV ads runnning at the same time, and then.... from April through June we'll be doing the same thing in the top 20 markets with TV. We will be doing national advertising in the video games mags clear thru June, a series of mall events, screenvision (in movie theatres), wild postings, and sponsoring the Scorpions 14 city national tour of the US as part of the AvP promotions. How's that sound? :)

<[Ringo] R.MONFORT> Hi, Bob. are developers getting new info regarding computers or new computers? I love the Jaguar. Thanks!

<[HoST] ST.LOU> I'd LOVE to love a Jaguar

Hi Ringo. You should really take that up with Bill Rehbock, Mike Fulton, or J. Patton. They're the developer support people. I don't track the current status of their updates to developers, I'm afraid. I can tell you that part of the efforts on the Jaguar are resulting in developer sessions here in Las Vegas during CES.

<[HoST] ST.LOU> Bob, everyone is playing their Jags while waiting. They love your cheats :-) Next we have A.STUDER.

I'm happy to see Atari moving forward, especially into the future. The Jaguar is a pleasant sight. Do you know when the first Jaguar title with QSound will be released and what we can expect from it? Will it use a special adapter or come out the SVHS/composite cables? Has the Jaguar's IBM development unit been completed? Keep up the good work! Happy New Year!

Hi Andy, I'll have to check on the Q Sound info. My good friend Bernie Stolar is there, and he's been in our booth quite a bit throughout the show. QSound relies on just two speakers for it's effects, so you should not need any adapter at all. The PC development environment is done to the best of my knowledge.

<[SWiTCHB0ARD] M.BALDEON> Congrats on your ad campaign, I live by San Francisco and to all those people who want to know what they look like there better then the Sega commercials (that's a compliment). Also thanks, the CG code worked and I only have one controller... had to switch it around. Anyway one last question... is Microsoft trying to get their hands into the Jag market (just a rumor).

Not to the best of my knowledge. Today we were told that the rumor is that Nintendo is trying to buy us...only the umpteenth time I've heard that one. :)

<[Dave] D.SHORR> What is the STatus of AtariWorks? Will a telecommunications module be added?

We're working on a beta version of 2.0, which at this
point doesn't have a telecomm module, but has lots of other
improvements.
** disconnected.

<[HoST] ST.LOU> This might be a sign, folks :-) Hahaha... the Nintendo
spies! I love it, King! Lots of funny /sends.

<[HoST] ST.LOU> Bob is back

Sorry gang....one of those nights I guess! Is it GEnie,
the hotel, or the node here in Vegas????

<[HoST] ST.LOU> Did we finish the AtariWorks question?

The answer was that there is a beta version of Works 2.0,
but it doesn't have a telcom module at this point in time.

<[Parrot Head] C.CASSADAY> Being the president of an Atari User Group
who would really like to have Atari's presence at our second Fiesta
Atari this June, discretion would lead me not to do this. However, I
feel myself and others would like to hear the rest of the answer to the
TT030 production question.

I'm not sure exactly where I fell offline...as I recall,
the question was "Are TT's being built again?". They are, but I am
unclear about what the plans are for them to be distributed, i.e. how
many come to the US, how many will go to Germany, etc.

<[Tony] WETMORE> You mentioned before that AvsP has been delayed until
April. Will you be able to post a list of "upcoming" Jaguar titles
sometime soon? As I recall, AvsP was one of the next expected titles.
No new games until April would be very bad. [:-(

Tempest 2000, Checkered Flag will be out in the next
couple of months. The 3rd party stuff will begin coming out in March
and April as well.

<[James] J.VOGH> When will Eye of the Beholder be out for the Lynx and
how many players will it allow?

We're showing it here at the show, I need to double check
on its availability. It requires a different board than the other Lynx
games as it permits you to save your score in the game. The board might
delay availability...but the software is done.

<[Ed & Mac] ERIDDLE> What Role-Playing Games are in developement for
the Jag? A BIG oversight on the SEGA frontier is the LACK of RPGs.
With a a few good showings you could capture that overlooked part of
the market...

I have a list of about 15 titles that are in the works,
guys. I'll get that up online ASAP. There are some RPGs in there, to
be sure.

<[HoST] ST.LOU> That would be greatly appreciated, Bob. I know you have been really, really, really busy lately but there has been LOTS of action in the Jaguar topics in the Bulletin Board.

REALLY, REALLY, REALLY, really busy. :)

<[HoST] ST.LOU> When you have a free week, you'll enjoy what is being posted.

And I'm sorry that I haven't been online at all.

<[HoST] ST.LOU> Shall I send you some archives ? :-)

I will try to get online after I get back home, and
yes...please send the highlights to me!

<[HoST] ST.LOU> Next we have Travis then Graham to close our evening.

<[Nat'l Champs] AEO.MAG> Really Busy Bob, there's a story making its way around that Atari is trying to "force" Jaguar development to be done on Falcon030s in a lame attempt to prop up the Falcon. (I'll leave it to you to figure out where this story is coming from.) What say you??? (BTW, thanks for the Jaguar cap and Tee-shirt!)

At least being in Vegas instead of NY I feel like I'm
getting closer to home!!

<[HoST] ST.LOU> Let me guess who spreads the most rumours per week...

Hi Travis...(oops, that last part was for Lou!)

<[HoST] ST.LOU> Bob, turn right for Sunnyvale when you leave Vegas :-)

That story is 100% false, we are also supporting the PC environment with the Jaguar. We are trying to force anything on anyone. Whoever said that simply doesn't know the facts, isn't connected to anyone that does, and proably isn't living right. :)

<[HoST] ST.LOU> "We are NOT trying to force...." correct?

Please stop all the /sends guys...

<[HoST] ST.LOU> Graham Norton, you have the evening's last question.

<[Graham] G.NORTON> Can you tell me why Atari decided that Jags and games can't be rented. A lot of people like to rent machines and games before they buy them just to make sure they aren't wasting their money. Also we have had a number of video game rental stores ask us about getting Jags.

Graham, before I answer your question, I want to be very
clear about my last answer.

<[HoST] ST.LOU> Please do :-)

I appear to have some hardware problems tonight. Along
with a lot of /sends.

We are NOT, I repeat _NOT_ forcing anyone to use the
Falcon or any other TOS based computer for Jaguar development. That is simply untrue. We are supporting the PC environment fully. Whoever said that we were attempting to force people to use the Falcon is mistaken, and if it is whom I think it is that is spreading this rumor, then it is NO SURPRISE that they don't know what they are talking about.

On to your question, (and please respond to my follow up
"What makes you think we are not supporting rental?") One of the companies that we are working with is Blockbuster Video!

<[HoST] ST.LOU> Graham, please ask your question again...

<[Graham] G.NORTON> Well mainly the notice on the side of the box that says no rentals allowed...

That's just standard legal mumbo jumbo. I don't have a box
in the room. But

<[Graham] G.NORTON> Quoting directly " You may not rent or lease the Products or parts thereof;

I suspect that if I did, there would be a spot that says
something along the line of "unless otherwise specificed", or something to that effect. I believe that license applies to end users, not retailers, Graham.

<[Graham] G.NORTON> Ok just wanted to check we want to sell some to various rental stores.

Again, we're working with Blockbuster Video. They are
doing rentals.

<[HoST] ST.LOU> Bob, short goodbyes and thanks tonight. I know how exhausted you are. Take care. Spend a restful weekend at home. We'll see you online.

Lou, my apologies for all of the problems tonight on this
end. Maybe this Stacy finally needs a tuneup. It has been a trying evening tonight with all of the line drops. But as always, I have enjoyed being here. I'm grateful for the support of our users online on GEnie, our official online service, and thanks to all for attending. Good night.

/|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\ /|\

Our next session of Dateline Atari will be held on Friday, February 4th at 10:00 p.m. Eastern Time. Real Time Conferences in the Atari ST RoundTable are held every Monday (Desktop Publishing and Graphics) and Wednesday (Open House) night at 10:00 p.m. and a HelpDesk is available evry Sunday at 9:00 p.m. On the first and third Thursday there is a Programmer's RTC at 9:00 p.m.

If you miss a conference, transcripts are made for all formal RTC's (where there is a special guest) and the programming RTC. You will find

these transcripts in Library 13 - Atari Archives.

Please send your questions, suggestions and comments to RTC$ via GEmail. Thank you.

101. Jaguar Realism

Newsgroup: comp.sys.atari.advocacy

I've been following informally the development of Jaguar for about 8 months now am impressed enough to make an investment in the company (ie. I'm putting my money where my mouth is). I have two distinctive views on this specific product,.. a technical view and a market view,... both of which I consider *vital* for determining the degree of success Atari will have.

TECHNICAL SUMMARY:
Rather than repeat the technical details of the machine itself, I'll just summerize what the specifications mean to me...

If the specifications that I have observed prove to be true, (and there is good reason to believe they are since they have come from multiple sources), the Jaguar machine is technically equal or superior to any machine currently available today, and I would venture to say that the soonest a similar competitive machine could be available is another 6 to 12 months from now. They have all the makings of what it would take to replace everything from the cable TV/cable Radio box.. to the telephone in the home at a price that american consumers are willing to shell out for. Not only does is have the capability for a variety of feature/functions, it has the capability and flexibility to perform some simultaneously! The Jaguar has what it takes from a technical hardware point of view to take the market by storm!

MARKET SUMMARY:
History can testify to all of the superior technical products/services which have perished a violent death for various reasons primarily related to the inability to create market acceptance or the like. So for the purposes of this discussion, I'll define the success of Jaguar as the degree to which it is able to build momentum in the marketplace and secure itself in the homes of america. The technical excellence of the Jaguar then only means that Atari has a *chance* to become successful, not a guarantee. Should their marketing/distribution efforts fail, then the Jaguar too will die a quick death. I believe the reality of the situation is that Atari has a matter of months to secure their market acceptance before a MAJOR competitor attempts to steal it from them and do what they should have done (and hopfully will do). The competitors are many and the stakes high enough (ie. interactive TV, games, etc.) that TCI, Sega, Nintendo, etc. aren't going to just lie down and let their bread & butter be stolen! I would estimate that if Atari doesn't have concrete plans *being* executed and not just talked about by September or October of '94,.. they won't stand a chance in the market. They need 3rd party developers big time, and the PC development platform yesterday. Maybe even some arrangement to *give* qualified developers the toolkits free!

On the positive side... I have alot of confidence in Jack Tramiel and his leadership abilities, and I think he has enough foresight to not allow traditional weaknesses of companies Atari's size, ie. manufacturing, distribution, and marketing,.. to be a bottle neck to a great product like this! He's farm this stuff out to others to reduce the risk and increase the capacity for delivery. I only hope this is indicative of a clear, concise, and excutable plan/vision and that the bigger pieces are yet to be

revealed!

OVERALL...
The technical details for the machine have been determined, and I wouldn't expect much change in the near term, so its not so interesting to me to discuss eventhough I'm an EE. Now it's time for execution of a dynamic marketing & distribution campaign to not only recruit 3rd party developers by the hundreds, but to make as many of these boxes as they possibly can in a short period of time. Any hiccup could prove fatal, but if everything goes well, Atari will be the company of the decade, and it's stock reach the mid 50's! With the info I've examined, I'm inclined to lean toward the later conclusion!

: Narowetz@slab.unt.edu

Here they are:

64-BIT RISC-Based architecture with multi-processor array.

Data path runs at 106.4Mbyte/sec using 64-bit pathway.

Individual inter-system graphics processor running at 27 MIPs with an
internal 4K of zero wait-state SRAM equiped to do full range graphical
effects including high-level, very high speed rotations, shading, morphing
and has a programmable infrastructure so programmers can be more flexable in
what they want to do, they don't have to conform to specific guidelines
set by Atari for the graphics they want, they can basically change the way
the Jag makes graphics depending on what they want it to do.

Another processor, an Object Processor, basically works with the graphics
processor to enhance visual effects, etc. Can handle Sprite animation,
pixel-maps, and character maps as well as a full range of other
high-performace features.

Another processor, the Digital Signal processor, running at 27 MIPs
with the usual 8K SRAM puts out CD Quality audio and full stereo
and because it is indivdual it does not interfere with the fast work going
on elsewhere in the system.

They have a Blitter that takes on full Logical Operations at high-speed
like Z-Buffering and Gouraud shading.

Yet another processor, this time MC68000 class CPU, acting as a general
purpose control processor, basically monitors and manages the action
processors.

32-bit color system, putting out 16,777,216 colors updating at 850 million
pixels per second. System is Full-3D Ready.

ROM Reader/Cartridge and Interface takes 48 megabits of uncompressed data.
They can compress really big games and this goes to a max of 400 megabits.

Uses 16 Megabits of "hyper-speed" page-mode DRAM.

An optional double speed CD-ROM Drive.

ComLynx I/O for networking to other multi-console games. Interfacing system on all COMM units allows attachment to modems, digital optical data networks, as well as basically anything else that shows up later. It is very flexable in this area. It willl support analog interfaces too, along with keyboards, lightguns and mice. I doubt disk drives would even be a problem here.

Controller pad is kind of big, uses 3 fire buttons, pause, option, and a 12-key control keyboard with game-specific control/overlay options. So you won't have to use the same buttons for different moves in MKII as you do in MKI Sega/Genesis now.

It also has a high-speed synchronous serial data port, this works in conjuntion with the Cable-TV Networks, interactive games and other digital systems. Eventually if they ever get this data superhighway installed you could probably hook your Jag to it and play MKII with another player in a different state.

104. Jaguar's KASUMI NINJA vs StreetFighter& Mortal Kombat

Newsgroup: comp.sys.atari.advocacy

I have heard that ATARI JAGUAR's KASUMI NINJA martial arts game will blow both Mortal Kombat and Street Fighter away.

Anybody hear anything about this ?

I guess 850 pixels per sec that the 64 bit JAG can produce is hard to match. 16 bit CD quality sounds, grunts impacts etc are supposedly awesome. Supposedly 90 fighting moves.

game.master@TeamInfinity.com

They showed KN at the CES....CNN, on Showbix today showed a short segment of KN. I had 5 levels of parallax scrolling and the characters were easily half the height of the screen. The action sequences were very smooth also. And this was still a beta not yet fully optimized.....I can wait until it hits the market.....

What is Midi Maze you may ask? It is a game where all participating computers are connected in a ring through Midi cables. In this 3-D game the player is represented as a happy face. The goal is to shoot the other enemy players to gather points, and after a set number of points have been accumulated, then you win.

I am hosting such a party on Saturday, January 22. Festivities will begin sometime around 5:00 and will end sometime Sunday morning.

Please email me at bmich@cs.utexas.edu if you have any questions. All are invited. Hardware required is at least a 520ST, monitor, joystick cables, disk drive, AND TWO Midi Cables.

See you in the halls...
Brian,

Had a thought and was wondering what you guys thought. IF the Jaguar is successful and there is a large amount of software written for it and IF it is technologically\financially viable, do you think that Atari will get wise and do what the computer companies (Apple and MS DOS) have done and have their next machine (the puma?, the tiger?, the lion?....) downwardly compatible so that it can run that older software? Granted, the older software won't be able to access the new bells and whistles of the newer machine but it would give the new machine an established software base. Personally, I don't think the CDROM games would be much of a problem but what about the cartridge games? Look forward to hearing your responses.

Lots of cash probably. You need to buy rights to use the format, etc.
You need to buy rights to the name. You need to buy rights to advertise
for Jaguar, and to make anything in that context. Usually you also would
need some kick-ass demo game to show them to get them to even look at you
without laughing their asses off. You also would probably need a big name
in the video game or computer industry. In many cases new developers or
programmers who don't want to put up with that crap go through someome who
has the permission and sell their games to the new company. I think
Acclaim is one of those "licensed" promoter people...

There has been some talk on GEnie, nothing official mind you, that the Jag
II would basically use the same chip sets but at much higher speed to be
competitive with the upcoming Saturn and Project Reality. This way the
games should remain compatible, cartridge and cdrom. The proposed system
would again put atari on top once the Saturn and PR are release.....at
least we can hope......

After advertising for months that Lattice C 5.60 was available when it wasn't, it *does become available. We only had to wait 4 extra months because thy decided to rewrite the manuals and then couldn't organise getting the stupid things printed.

Now they are distributing packs which don't install properly because the labeling on the disks got mixed up.

I know the LC5.60 isn't that expansive but for a company that has got such a good reputation they really don't inspire me to want to buy anything from them again..ever.

They will, ofcourse, supply new discs but they really should be getting it right by now.

DAMN.

I'm very surprised to hear of your problems. I got 5.6 several months ago direct from Hisoft and apart from a bad disk, it installed fine. The manuals are a different kettle of fish though. Awful. Perfect binding is a mad thing to do with programming manuals. I still use the old set I have as the new ones are a pain to use and very badly laid out.

I have to agree with you, I much prefer the 'old' ring bound manuals, easier to leaf through and also much easier to find the information. Also no mention of the Speedo bindings except in the 'Modern Atari System Software' book. Has anybody tried the profiler programs, lprof and lstat?

Atari I think has said that the next Jaguar will be able to play current games
(probably mostly a faster chipset with a superset of instructions).

Um, who's the developer? It looks like the desingers had the 68000
in the Jaguar from the start. In a round of cost reduction, the
68000 was going to be removed, but the designer resisted.
I don't see anything about developers asking for the 68000 and
Mathieson wedging it in.

[...]

: John Mathieson <CIS: 100111,2631> - one of the designers of the
: Jaguar - speaks with authority on Jaguar hardware:

[...]

: As one of the Jaguar designers, I thought you might like to know
: why there is a 68K in Jaguar. (I did the GPU & DSP, and the
: blitter). In one of our cost reduction drives, we seriously
: considered no CPU, however I vigorously opposed this as the GPU and
: DSP are unfamiliar to programmers, were never meant for overall
: system control, and are only really fast out of their relatively
: small internal RAM blocks. The principle is that you get your RISC
: processor to do all the intensive but fairly simple low level parts
: of a 3D game, and you get a CISC processor to handle the high
: level, complex, but fairly un-intensive parts - e.g. game-play,
: view point control, collision detection, etc. Those complex
: addressing modes are great for rattling round structures. Its also
: important to have a manager in a multi-processor system, and the
: 68K performs this task well.

I guess this little episode shows how people can take the same information and come to different conclusions, which is probably prevalent in all newsgroups, not just the atari or amiga groups.

He refers to the GPU as the GPU and DSP as the DSP, wheras most people are calling them all CPU's and saying that the 68000 is not a cpu. Mathieson doesn't refer to the system as a parallel processing system either, just a multi-processor, which a lot of systems on the market are. He more or less says that the 68000 is *THE* CPU, as a jaguar sans-68000 is CPU-less.
Then again, Mathieson is just one of the desingers, the marketing guys always know better ;-)

Sure, it's possible - in fact, the s-video cables (with stereo
connectors as well) will be out pretty soon, and they already have
composite connectors with composite video and stereo output.

Or, if you feel daring, you can make your own cable - but the Atari
cable only costs $20 or so, and is probably the best way to go for
what you want to do.

If you have access to GEnie, someone uploaded the pin out on the AV
connector. This gives the composite, s-video and RGB pin out.

Ken, can you or anyone else shed some light on exactly what the *Saturn* and *Project Reality* is suppose to be? It sounds like they're potential Jaguar competitors from... Nintendo and Sega maybe? Any and all details will be appreciated. Thanks in advance...

More agreement from me, too! The binding is a bind. The functions reference
are in a strange order, so I have to look in the index first. The functions
aren't started on a new page like they were in the old manuals, so it's not
quite so easy to find something on a quick flick-through. BUT, the biggest
gripes for me are:
1) The command line options for the compiler are not conveniently
listed, I have to wade through stuff on the integrated editor etc to
find them.
2) Although it all claimed to be `up-to-date', the newer functions
(Speedo, AES4 etc) are documented separately (in the Modern Atari
Software book) to the old functions, so one has to consult at least
two manuals at a time.
3) WERCS cannot cope with new resource files with CICONs, eg it cannot
edit DESKCICN.RSC
4) Wrong bindings for several SpeedoGDOS functions.
5) The manuals are shite. I know I mentioned this already, but they're
so shite that I thought it was worth mentioning again.

They never ever mailed me to tell me that the upgrade from 5.5 was available,
I only got it when I asked Alex Kiernan at the Atari show `in' Manchester.

And I had two duff diskettes too :-(

Yes, and thats the problem with Atari. They have a history of
taking good products and screwing them up. Thats why so many people
are so sceptical about the prospects of the Jaguar. Frankly I think
it would have been better for Nintendo to have marketted it, we
would be looking at a surefire hit. With Atari, chances are high
that it will flop as the Lynx and Falcon did.

At last, you seem to have recognised reality. Maybe after all
your wild claims for the Jaguar you finally see that perhaps it ISNT
the surefire safe bet for a games system with a future. Not because
it is a bad peice of hardware (its technically excellent as was
Atari other great `success`, the Lynx), but because

ATARI ARE A REALLY CRAP COMPANY.

Yep, I was speaking to a guy at a computer games shop about the
Jaguar and he reckoned it was going to do really well. Then his
friend joined in with a reality check and pointed out that
"everything Atari do dies". I couldnt have put it better myself. If
it took you four months to get a dealer to sell you a Jaguar, do you
think that a consumer (who hears about the potentially even MORE
amazing Sega Saturn) is going to piss about trying to get one? If
Atari dont sell a lot NOW, before next Xmas, then the Saturn looks
set to KILL them. If only they had been able to get the jaguar out
in numbers before this christmas.....

I`m not applying any Amiga bias here. In my opinion the Amiga is
dead right now too, killed by the same incompetance and ineptness at
Commodore, that is prevalent at Atari. It is basically in its
twilight, about to be eclipsed for good by the PC because commodore
screwed it up.

What is it about American companies that makes them so pathetic??
It seems that the American computer industry is every bit as crap as
the American automobile industry, and shows signs of going the same
way.

So in other words, the Jaguar does NOT have a 64 bit processor.
It just does some memory transfers along a 64 bit bus. It is
inherently a 32 bit design, but can do 64-bit transfers in certain
parts of its architecture, just like the AGA chipset in the CD32.

When I pointed out that the `64-bit` and `Multimedia` claims
were largely just stupid hype last week, the usual barrage of claims
from the space cadet Atari advocates followed.

Let that be a lesson to those in this group who blindly (and
STUPIDLY) advocate anything that Atari say or do. When will you face
reality and examine ALL the FACTS about the systems you so foolishly
advocate???

Oh I don't know, the way I understand it is that there are TWO 32 bit
RISC processors- now you can't tell me that two different 32 bit RISC
chips can't work on 64 bits (combined) at once. I beleive their claims
to be legit, not just because I own an atari (and like it BTW) but
for the fact claims made about virtually any system TG16 and project
reality included are always paraphrased to their advantage. This is not
a lie. Heck, even commodore has done their share of "inadequate
disclosure"... This is just a fact of industry.

I just called Atari today.... complaining about the controller cable keeps falling off...and too short....

The customer service guy goes...
"Yeah, due to the exciting game play that Jaguar machine offers, people tend to move their controllers a lot..."

(well, my roommate's mouth is always open....but...I don't move my controller a lot...)
I told him
"but, it never happened with my SNES."
He replied
"oh, uh, I don't know about SNES....blah,blah,blah"

"should I go get a new one?"
"uh, no, just don't move your controller."

what, what? damn...even before Jag makes big in the game market.. Atari seems to be adopting the big corporation attitude developed by Nintendo and later, recently adopted by, Sega....

They shoud have more female service representative, they were always nice when I called them....

oh, one thing...the guy said new cables are three meters long... but mine is only 4.5ft...

This is pure nonsense. Atari is actually marketing the Jaguar, and
has done numerous things to help the Jaguar along that they have never
done for any of their previoyus systems. They also had a nice large
booth at the winter CES, right next to Sega and Nintendo. Atari may
screw it up, but so far they show no signs of it.

Also, the Lynx is coming back - after all, if Nintendo can sell
billions of that lame green machine, Atari can certainly sell a lot of
Lynx's when backed by Jaguar units.

Oh, also, the Falcon is not a flop - as much as you'd like it to be.
But this has been argued endlessly, so I won't go into more detail.

Yeah right, do you really think the Saturn will be out before this XMAS? Now who has a loose grip on reality. Remember - Microsoft is doing the OS!! Ha Ha Ha Ha Ha!! That ought to put an end to any speculations of a '94 release.

CBM is dead in America (the small off-center booth at CES shows they have no wuill to capture the AMerican market). I have no doubt they will survive, though, driven by the Dark Side Of The Force and a bitter hatred for Atari (Well, that plus euorpe... :-))

>
> What is it about American companies that makes them so pathetic??

No Way. American companies are on the upswing, and Japanese companies will soon pay for underestimating them. Sega probably will live, maintaining current market share - Nintendo is down for the count.

No it is a 64-bit design - it primarily works with data 64-bits at a
time. Since when did ANY CBM product have 64 wires over which data
traveled at one time - answer for the fans at home - it never did.

>

And thants because your claims are baseless. Of course it doesn't
have 64-bit internal registers - what a waste! It has 64-bit data
transfer, which is what matters.

>

You must learn to face reality yourself. The days are gone when a system just has one CPU. The Jaguar is primarily a 64-bit machine where it counts, and that is why it is so valid to say so.

Plus, it sure helps the marketing!

The Saturn is going to be Segas next generation game machine. Originally it was announced as a 32 bit machine, but after atari released the Jag, they claimed it would be 64 bits:-). It is due to be released christmas 94 in Japan ONLY at this point, though some have advocated that it would be released in the US also. They, Sega, have signed a deal with Microsoft to do an OS for the Machine. Initial rumours indicate that it will be an optional OS, more for use with multimedia than games. The last report showed that it's specs were better than the Jags (I'll see if I can find the post on GEnie and repost here) and would come with CD only (4x speed) and sell at 400-500 US dollars (I think this is a joke, 4x speed cdroms go for more than that nowadays).

Project Reality is Nintendo's next genertion game machine. This will also be 64 bit and supposely kick the Saturn and Jags ass though it is not due out for 2 more years (can anybody say Nintendo CD:-)). The same post from GEnie gives the specs on PR. It is supposely optimized for virtual reality based games. They showed a system at CES with a VR game but it was running on a extremely expensive computer (I dont't remember what type) Their, Nintendo's, comment was that they would beable to deliver the same performance on a 350 dollar game console :-) .

They are right, the new cables are just over 7 feet long. When I finally
got my direct order unit, it came with thelonger cable, as did the extra
controller that I ordered.
Unfortunately your problem with the cable is not fixable, since atari
basically went with a monitor cable connector and did not put the screws on
them that a normal monitor connector would have, hence they fit a little
loose. With the 7 foot cables, I have not had a problem with the cable
coming off, except when I accidentally got my foot caught in the extremely
long cable while I was walking to the kitchen and pulled it out:-).

And the install program is *still* broken. Grrr.

And the standard lib is not MiNT-aware. GRRRRR! I mean, it works, but
it can't handle long filenames etc. The MiNT libs from a.a compile Ok
though, and seem to work pretty well.

Bullshit. Does the Cd32 have a 64-bit bus. NO.
The majority of work done on the CD32 is done in 32-bits.
The majority osf work done on the Jag is in 64-bits.

> When I pointed out that the `64-bit` and `Multimedia` claims

When Atari say they have a 64-bit system, they are right.
I see a 64-bit bus. I see 64-bit graphic chips. I see a 32-bit chip
well interfaced to the 64-bit bus. I see a 64-bit system. You
see an Atari console, and you look no further.

When will people like this amiga owner wake up. I have no problem with
what Atari is NOW saying about the console.

Nope, ITS NOT! It is as 64-bits as the Pentium is.
If you are 64-bits, you gotta have 64-bit registers with 64-bit
operations.

|> it primarily works with data 64-bits at a
|> time. Since when did ANY CBM product have 64 wires over which data

The AGA chipset has a burst mode to get 64-bits at a time. This could
be construed as '64-bits' using the same logic.

|>

TSK TSK. How do you do calculations? Mathemathical operations?
How is the transfer? to its internal memory to THEN process it
at 32-bits? Dude, get a clue.

|>

The Jaguar has 64-bit data bus. Doesn't have 64-bit processing.
Kendall, now that I read your signature I am surprised. Didn't
you read my mail?

Well, knowing SGI, and if someone said it was "extremely expensive" it was
the SGI ONYX. Goes for about $160,000.

(And no, nothing Nintento ever puts out will be a fraction as powerful.
The chip use in the Nintendo would be at best R4000 level (and that
would jack the price up a lot at this point). Silicoln Graphics
"Indy" goes for $5000. It can't hold a candle to the ONYX, although it
will do some very cool stuff compared to similarly priced machines.

Sorry but the original poster is quite correct. The AGA chips do two 32 bit word fetches in one memory cycle in certain graphics modes, and therefore is doing 64 bit transfers. Download the AGA hardware manual (in amigaguide format) from wuarchive.wustl.edu if you don't believe me.

And so does AGA. In fact, if you have an AGA machine with FASTRAM (yes, you can get it for the CD32 now), then the machine can be moving up to 96 bits of data around per clock cycle. (32 bits for the CPU, 64 bits for the graphics)

I had to laugh at this one! Couldn't some people be more
hypocritical than what they already are? The Falcon 16-bits...
Using the same logic it is!

Like I said: The Jaguar is as 64-bits as the Intel Pentium is.
64-bit data transfers helps, but it isn't the 'total' 64-bits
of power that you expect from the name.

BTW, Jim, that was a good one!

The Saturn is Sega new machine. supposedly, developers are starting
to get dev units now. It is suposed to be out by Dec. 94, but
recently Microsoft announced they are doing the Saturn OS, so a
realistic release is sometime early '95. The Saturn is supposed to
cost about $500, and is a CD only unit.

Project Reality is Nintendo's pie-in-the-sky next generation gaming
system... but even the most optomistic projection (i.e. Nintendo
themselves) say late '95. Also, PR (good anacronym, eh?) is based on
the idea that you can bring the cost of a $30,000 SGI workstation down
to $200 by late '95 - in other words, they are grasping at straws.

This is a pretty loose description of the two machines, but should
give you some idea of what they are at least.

Say again?
It does TWO 32-bit fetches in ONE memory cycle? You mean it has some kind
of burts mode, and if this is so, then YOU are WRONG.

The majority of work done on the CD32 is in 32-bits, whereas, on the Jaguar,
this figure is 64-bits.

Dont turn to side issues, because at the end of the day, your AGA chips are
attached to ONE 32-bit bus, inabling them to only fetch 32-bits at a time,
even if they do have some kind of burst mode.

The 68020 can do 32-bit fetches over a 16-bit bus, but this does not change
the fact that it makes 16-bit fetches to memory.

Thank you.

Yes it is, BUT it is not that important since the time delay when
transfering 32 bits compared to 16 bits is only about 5%.
Don't ask me how its done! Hardware...

It does two memory accesses in one clock cycle, yes

|>
|> The majority of work done on the CD32 is in 32-bits, whereas, on the Jaguar,

32 bits at a time, two accesses in one cycle, therefore 64 bits per cycle. Like I said, if you don't believe me, download the specs.

|>
|> The 68020 can do 32-bit fetches over a 16-bit bus, but this does not change

On two seperate clock cycles, yes.

|>
|> Thank you.

You're welcome!

What exactly do you mean by 64-bits of power? What kind of data are you working with that you need to perform operations on 64-bit registers? I'd really like to see an example of that. The point is that for processing and addressing, 64 bits is overkill. Good engineering means ensuring that every component of a system is able to operate at its maximum efficiency, and as far as I can tell, that's what the jaguar does -- the graphics subsystem, which can actually *use* 64-bits gets it while the cpu, which would never need 64-bits works at 32. Having a 64-bit register that is only half full is not power.

>The binding is a bind. The functions reference are in a strange order, so I
>have to look in the index first. The functions aren't started on a new page
>like they were in the old manuals,
These and others points I raised in the hisoft conference on CIX and it didn't receive a reply although several others agreed with my views. Take that how you like...

When the Addendum manuals for v5.5 came out I pointed out to Alex K that a rule or something to separate the functions would be in order and they are hard to find on a page in lower case with upper case subheadings (weird). He said he would think about that. Obviously, he didn't. The index also has many functions missing so we can't even rely on that to find them now they are split up into header file order...

Some functions are also missing from the main body - the '_*' Lattice functions like _toupper.

I also find the fact that we are charged extra for the MASS book which is nothing but program documentation IMHO hard to swallow.

Header files are still out of date. Take COOKIE.H. It needs the following added

```
/*
* added by MSB 29/12/93
*/

#define _OOL0x5f4f4f4c
#define MiNT0x4d694e54
#define _SLM0x5f534c4d
#define _INF0x5f494e46
#define _AKP0x5f414b50
#define _IDT0x5f494454
#define FSMC0x46534d43
#define PMMU 0x504d4d55
```

Some of these are mentioned in MASS but aren't in the header file!!

In the GDOS detection functions in VDI.H
#define GDOS_SPD0x5f535044/* _SPD */

needs to be added for SpeedoGDOS detection.

I'm sure there are other things, and I can't help feeling disappointed for my 60UKP!

Regards
Mark

I had not found the original cable length too short, however, when my second joystick which you must order had arrived, the length is significantly longer. Also the button colors are non-matching. One joystick is grey colored the other black.

You will be happy with the new length. What can atari do besides make it longer? Why complain?

>but mine is only 4.5ft...

well he does have a little bit of a point in that unless you are
willing to spend more money for a controller, NOT moving it would be
a solution. On the other hand, if you so desired to get a new
controller, I'm sure they would be more than happy to sell one to
you. I'm not sure how much a controller costs, but if it is a lot then
I would definately consider not moving it as an alternative (I am
assuming here thatthe controller will not fall out IF the machine is
not touched). Then again there is also the scotch tape- rubber band
alternative. :)

Do you know what a clock cycle is? I'm afraid you cant, because a chip can
only do ONE operation in a clock cycle, and reading 64-bits off a 32-bit bus
in ONE cycle is impossible. Sorry.

>|>
>|> The majority of work done on the CD32 is in 32-bits, whereas, on the Jaguar,
>|> this figure is 64-bits.

>I thought the jaguars porcessors were all 16 or 32 bits?

You thought wrong. It HAS 32-bit processors, but these make use of the FULL
64-bit bus, loading TWO 32-bit registers in one memory cycle.
It also has a 16-bit processor, the 68000, and I dont know how it is coupled
to the 64-bit. I would suspect, due to the low load on it, that it only uses
16-bits of the bus.
But more importantly, there are, to my knowledge, at least two FULL 64-bit
chips. One is the blitter, the other the video shifter. Both have 64-bit
registers.

>|>
>|> Dont turn to side issues, because at the end of the day, your AGA chips are

>32 bits at a time, two accesses in one cycle, therefore 64 bits per cycle. Like I
>said, if you don't believe me, download the specs.

Look. They may be able to do two loads in the time it usually takes to do one
load. This would be a burst mode. But this can only be done when the addresses
are serial (side by side). It is used by blitters to do quick memory operations. No big
deal.

It still does not take away from the FACT that the bus on the CD32 is 32-bits, and the Jag's, 64. Not to mention that the clock rate is higher on the Jag.

WHAT! Does the A1200 have a 64-bit bus? NO. It only uses a burst mode,
like every other cheap blitter out there. The Falcon has a 32-bit bus,ok!
Stop throwing this stupid 'AGA 64-bit access' crap! You dont know what
your talking about!

The Falcon has a 32-bit CPU on a 16-bit. It has 32-bit 'graphic' bus,
meaning here, that the shifter and other graphic chips work on a
32-bit data bus.

You could call it either, but it tends heavily towards the 32-bit.
You would find it is closer to a 32-bit computer design then a
16-bit one.

Says who? I've got the AA Chipset Specification here and it says data is
passed from Alice to Lisa in 64-bit chunks. The Alice/RAM connection is
32-bit, and page mode is used to fetch data (=burst).

>The majority of work done on the CD32 is in 32-bits, whereas, on the Jaguar,
>this figure is 64-bits.

Depends on what you mean by `work'. All computation in the Jaguar is done
in 32-bit quantities, although blitting ops are done in 64-bit quantities.

Does it do that most of the time?

Also, let's look at this 64-bit transfer thing.

You have a 32-bit bus, right? so, how is it possible for a bus to
transfer twice its capacity in one clock cycle, hmm?

Nope, using my logic I conclude it is a 32-bit computer. You may be
incorrectly using my logic, but I can't help that. You are trying to
apply game system logic to a computer, which I myself do not do.

But burst transfer still takes more than one clock cycle to transfe
the data across the 32-bit bus. In once clock tick on the Jaguar bus,
64-bits of information is loaded into two registers in the TOM RISC
chip. you CANNOT transfer more information than the width of the bus
in one bus clock - in order for any chip to receive twice the amount
of info than the bus could carry, you would have to clock the bus
twice as fast as the chip.

Yes, calculations are done in 32-bits - but for a game console, that
is all the accuracy you need! For a computer, many applications
demand much more than this in the way of accuracy. For a game
console, what really matters most of all is how fast graphics can be
pumped out.

That's not really the definition of a processor. Both the blitter and the
video shifter count as processors. They are not *main* processors, and I'd
say shifter is not a co-processor in the traditional sense.

However, what would you call a chip that can do real-time 24-bit gouraud
shading? That's what the Jaguar's blitter can do.

^^^^^^^^^^^
: a warm and happy feeling that I own no Amiga products...

Add zero literacy for the typical Atari loser, which distinguishes
him from the typical Amiga Luser (sic).

: ha Ha Ha Ha Ha Ha Ha!!! Boy you Amiga people are a riot.

You Atari fans are the most pathetic of the lot. That lousy falcon
sold only 15,000 units world-wide. There are probably more Crays
in the world than Falcons. I can understand why there's so much
hostility towards a competitor, such a CBM, that has out-sold and
killed the market for Atari ST/STE/TT and Falcons.

You post a crappy definition of a 64bit system and using your crappy
definition, the Atari Falcon is a 16bit machine. But no, you make up
some other definition to make the Falcon a 32bit computer, while still
maintaining that the Jaguar is a 64bit system. Using a lame excuse
that video games and other electronics, such as computers don't have
to use the same meaning for the same term (read "oh, it's a video game
system, Atari is allowed to LIE") doesn't cut it for me.

Perhaps only DEC can rightly call their Alpha a 64bit system. All the
general purpose registers and pointers are 64bits wide in the Alpha AXP.
NB, I'm not implying that current implementations have 64 bits of real
address pins.

Hewlett Packard don't claim their HP-PA Risc architecture is a 64bit
system, even though it has a 64bit FP, 64 bit data path to cache and
up to 256 bit DRAM path because it has a 48bit address space.
They don't go prancing around saying "256bit power coz we get a 256bit
data bus!"

So, how big are the registers in the Jaguar's Tom and Jerry chips?

Now Atari throws some marketing fluff about "64 bit system" and all
you "technically literate" Atari followers swallow all the ad-copy
and start recycling it over and over again. Do you guys have "truth
in advertising laws" in the US? Atari have had to withdraw ads in

Australia because they have been found they fail to meet the "Advertisements shall be truthful and shall not be misleading or deceptive" clause. NB. These ads were for their ST range of machines.

Does Atari even have a design and verification process for their GPU's? Or how about publishing errata sheets for their processors, like ARM for the ARM2 and ARM3, DEC for their VAX and Alpha, MIPS for their MIPS R4xxx series, IBM for their RS/6000 and Motorola for their 680x0 series. Lots of CPU manufacturers seem to have a lot more know-how when it comes to making CPU's and GPU's and perform rigourous testing to make sure their processors work, and misfeatures are well known.

Or they so featureless that they approach ASIC-like processors, performing simple deterministic tasks?

And before you say, haha, Atari don't make mistakes. How would Atari know without running lots of bizarre instruction sequences using directed and random testing. Do they know what happens when they get cache misses, TLB faults, floating point exceptions? Do they make Motorola perform full fault coverage during the manufacturing process?

I like to see your informed reply to *ALL* the points I've raised Mr Gelner, as you accuse me of being clue-less. And calling me an "Amigoid" is rather childish on your part, when I have stated that I don't own an Amiga, just a 486 box. And yes, you will be marked on spelling and grammar, as you have a preoccupation with measures of literacy.

Umm .. I guess the use much more than that for calculation .. the 56001 DSP in the Falcon is a 24 bit DSP, but it can use up to 96 bits for calculation .. (mostly 56 bit though) ... I think Atari uses the same techniques on both Jerry and TOM ...

(It's not the same thing as using more 32-bit registers .. :-)

The thread about Jag 64bit or not is very silly, developers and hardware fanatics has several times stated it's a TRUE 64 bit machine .. yet all these 13-year old Amigoids just HAVE to call it 16 bit or something as stupid.

Source record: 19227

Does anyone have any statistics for the number of Falcons sold? Flipping through an old copy (July) of ST Format it sid that Atari had planned to sell like a hundred thousand falcons by Christmas '93. I can't imagine that it's been anywhere near that mark - anyway, I'd appreciate some feedback as my partner and I are considering buying one to use for MIDI/HD recording, but I'd also like a machine that has some sort of future to it.. a few games would be nice too.

Thanks
Jon

178. Lattice C 5.6 Bug Alert

Newsgroup: comp.sys.atari.advocacy
Date: 1994-01-30 21:12:27 UTC

Hi,

If people want to send me details of things they have found wrong with Lattice
C 5.6, as well es extensions to the OS not supported in the current stuff
they are sending out (such as multicoloured icons in the WERCS program)
I shall contect Hisoft and see what their plans are to correct the errors.

Xavier

mail me as sys1@exnet.com

Halfway through a Cambridge computer science degree.... maybe towards the end
you will mature a bit.
I think perhaps you should think a little before you post, and take your
fascist attitudes elsewhere.

Sheesh, you guys act as if Kendall is the person responsible for the whole 64bit thing. I've got some rope and know of several trees that would be suitable, if that would make y'all feel better. ;-)

Oh come on now, it's just marketing hype, something which has been proven to sell things. If you guys want to insist on complete truth in marketing and advertising, don't you think that all companies and their products should be held to the same standard?

BTW, the comment above about the HP's 48bit address space brings up
a good point. The CD32 has a 68EC020, right? Doesn't that chip have
a 24bit address space, not 32bit? Using the logic above, shouldn't
Commodore be similarly chastised for claiming that the CD32 is a 32bit
machine? Wouldn't CD24 be more appropriate?

> Perhaps one should be started for videogames...

That may well happen, but somehow I bet that Nintendo, Sega, Atari,
Commodore, Panasonic, Sanyo, Philips, etc. will try to fight it. You
have to remember that these consoles are all consumer items, not real
computers. The average Joe and Jane Sixpack are going to buy them
for their brats in much the same manner that they will buy VCR's,
TV's, and other more common entertainment appliances. If the consoles
are to truthfully marketed and advertised, other appliances should be
as well.

One thing that I can't figure out is why anyone cares how a company
markets its products. Is there a reason why consumers need to be
protected? If they are too stupid to do a bit of research about what
they are buying it's their fault, not anyone elses. I for one do not
relish the thought of various agencies trying to protect me from the
companies with ridiculous rules and regulations.

Could it be in two clocks? Could it be the bus runs twice as fast?
Many things could be, but the transfer exists... I gotta read it.

Remember the 68030 and its burst mode? It allows for filling
the cache and moving memory very fast.

|> Nope, using my logic I conclude it is a 32-bit computer. You may be
|> incorrectly using my logic, but I can't help that.

Nope, I am not. If the Falcon's CPU has 16-bits to external memory,
then its performance suffers big time. The graphics will do nothing,
until the Falcon's CPU does something.

|> You are trying to
|> apply game system logic to a computer, which I myself do not do.

Ah, but wasn't the Falcon supposed to be a 'great multimedia/video/
graphics machine too?' Or is it '16-bits' for graphics and '32-bits'
for running programs that get a benefit from its cache? It's THE SAME
LOGIC, Kendall.

They are called CO-PROCESSORS, not processsors.

How would you call a chip that can do 1.0 MegaFlops? A 68882 FPU coprocessor
is one like that, and you don't call it PROCESSOR.

The higest figure I hear was along 20,000 machines. If you are into MIDI/HD
recording, I'll suggest you get one, regardless of the games that come out
for it. They won't probably be much, since the installed user base is small.

If you love ATARI, then get the Falcon and the Jaguar.

This is my suggestions. If you can't live without a machine with games
and MIDI, consider a PC or an Amiga.

In article <1994Jan18.154744.66706@rmece02.upr.clu.edu>, you wrote:

Mathieson's post on CIS

John Mathieson <CIS: 100111,2631> - one of the designers of the Jaguar - speaks with authority on Jaguar hardware:

From my limited understanding of the 3D0 hardware, I believe that Jaguar out-performs it by a factor of two, broadly speaking. Of course, both systems have their strengths and weaknesses, but I believe Jaguar is much better suited to 3D animation compared to 3D0. Also, we (Atari) publish the full hardware specification (to signed-up developers), whereas 3DO force you through an OS. Games programmers tend to want direct access to the hardware and full control of the system.

Jaguar can produce an interlaced display with 720 pixels across readily. In fact, the maximum resolution horizontally is around 1350 pixels, although you have to do some tricks to have more than 720 pixels horizontally.

As one of the Jaguar designers, I thought you might like to know why there is a 68K in Jaguar. (I did the GPU & DSP, and the blitter). In one of our cost reduction drives, we seriously considered no CPU, however I vigorously opposed this as the GPU and DSP are unfamiliar to programmers, were never meant for overall system control, and are only really fast out of their relatively small internal RAM blocks.

[SEE?]

The principle is that you get your RISC processor to do all the intensive but fairly simple low level parts of a 3D game, and you get a CISC processor to handle the high level, complex, but fairly un-intensive parts - e.g. game-play, view point control, collision detection, etc. Those complex addressing modes are great for rattling round structures. Its also important to have a manager in a multi-processor system, and the 68K performs this task well.

Because the GPU and the DSP both out-perform the 68K so significantly, I joked that the 68K was "only there to read the joysticks". This joke seems to have spread a little far, so lets kill it now.

The answer to Jaguar's bus width is that it is 64 bits where it needs to be. The two highest data rate paths, which are those between the RAM and the object processor (display generator), and that between the blitter and RAM, are truly 64 bits. The blitter can generate Gouraud shaded pixels as fast as the DRAM can run in page mode (13 MHz for us), so it can do 52 Mpixels per second in Gouraud shaded 16 bit pixel mode. The display generator can load pixels into its internal buffers as fast as the RAM can supply it.

The RISC processors manipulate 32 bit data as this is all the precision they need. They have 32 bit ALUs and 32 bit address

generators.

[SEE?]

They can perform 64 bit transfers on the main bus if
they need to, but not many data are this big. The graphics
processor uses the blitter as a co-processor when it really needs
to blast pixels. The instruction size is 16 bits as this allows a
reasonable number of instructions plus two register/data fields in
each instruction.

The name of the game is bus saturation, if you can keep a 64 bit
bus fully utilised, then your processing elements are as fast as
they need to be. Well written Jaguar code can get close to this -
you ain't seen nothing yet.

By the way, the first time I saw Alien Versus Predator I did not
believe Jaguar could do that. I look forward to many similar
surprises.

No Rickard. Your are the one who has shown from time to time to be
a lame ignorant.

I remember when you said the Falcon '30's could have burst mode
which goes against Motorola's claim, that to have burst mode, you need
32-bit access for the '030. I told you to experiment turning on/off
the burst mode.... well, did you try or did you not?

>
>you never proved to me you actually could. I'm still waiting...

I think you just dug your own grave here...

The Falcon can overlay two 16 colour screens very easily (as can any computer capable of displaying 8 bitplanes)... heres how...

- put the falcon into 8 bitplane mode.

- playfield one goes into the first four bitplanes..

- playfield two goes into the bitplanes 5/6/7/8.

(got that so far... (I know your a bit slow ...))

now colours 0-15 are set to the colours required for playfield 1.

now for playfield 2 to be overlayed transparently you
repeat the colour value for each of the second playfields colours 16 times
i.e. colour 0 of playfield two occupies colours 16-31 of the palette.

IN THIS WAY, THE SECOND PLAYFIELD IS OVERLAYED TRANSPARENTLY JUST LIKE DUAL PLAYFIELD ON THE AMIGA. *NO MASKING* IS REQUIRED.

the only advantage of the amiga is that you can scroll each playfield independently. On the Falcon to scroll both you scroll one with the h/ware scroll and blit the other one. But this takes only 1/3 of a vbl, and u then HAVE no need to restore BOB backgrounds which in a game with a reasonable no. of bobs would take this amount of time anyway.

PS. In 8 bitplane mode, The falcon suffers only 20% video contention.... I think AGA suffers about 60% contention without fastram when displaying dual-playfield, so the overhead of the blitting is even less important,esp. when u consider that all CD32s have no fastram.

I'm an amiga owner myself and I'm more than happy with calling the Jaguar
a 64bit system and the Falcon a 32 bit system. Sure not every feature
in these machines is this wide but the important features relative to
the domain of application are.

Anyway any person can tell you that to label a system as "N-bit" is pretty
meaningless, technically its the performance in particular scenarios that
counts, and in the fullness of time the ability of the system to reach
and surpass the requirements of the user -- whether its simply being used
to play off the shelf games, or as a platform for coding demos and so forth.

I think fascist is a rather stupid word to use in the context of
these post. If he was saying, all Atari owners should get off
welfare, get a job and give up the NHS, he might be considered
fascist, or right-wing reactionary.

Fascist might be trendy word to throw around at the University of
Kent, but has as much relevance as me saying you were a dirty red
commie.

Is the University of Kent a low class school or something, as you
seem to be displaying an extreme inferiority complex? Oh well,
the Brits and their class struggles ;-)

- Jim

PS. It's best to use sentences, instead of the "..." that everyone
seems to be using, as if they were on the telephone and having a
pause to gather their thoughts.

Well, If we're going to get into this crap - beat the processing power of my 4 processor RISC-based Sparc 10, or for graphics, my SGI Indigo II Extreme. PCs (and clones) suck the big one.

Karl.

P.S. Personally I like my Falcon 030. Instead of crapping on about datapaths and the such, I USE my computer. (And not just for reading this flame-fest. ;^))

That's spelling, not literacy. Any idiot can run a spell-checker over
his post, I just prefer not to wait. I note you did not flame my
grammar, I'll take that as a complement.

Sure, I'll admit to the (more than) occasional spelling error. My one
flaw is a lot better than those listed above... (all of which the post
I originally responded to had in plenty).

>: ha Ha Ha Ha Ha Ha Ha!!! Boy you Amiga people are a riot.

>killed the market for Atari ST/STE/TT and Falcons.

I see you take the typical approach of ignoring the topic at hand (the
Jaguar), and attacking other Atari products, all in the wrong group
(followups redirected where they belong).

My anger is not directed explicitly at Amiga people or products, just
at those who present incorrect information. There are many reasonable
Amiga people around... Just as there are unreasonable 486 guys. I
just assumed Amiga to start with, seeing as how the discussion
originated in the atari.advocacy group. What exactly a 486 guy is
doing there is beyond me... but it usually indicates some deep hatred
in the persons system, directed at Atari.

>
>You post a crappy definition of a 64bit system and using your crappy

>

Just because you can't follow it, does not make it false. I am
merely presenting a simple explanation of why calling the Jaguar a
64-bit machine is reasonable, and am trying to point out to SOME
people how computers are really a different matter, and a lot more
complex.

>Perhaps only DEC can rightly call their Alpha a 64bit system. All the
>general purpose registers and pointers are 64bits wide in the Alpha AXP.
>NB, I'm not implying that current implementations have 64 bits of real
>address pins.

So, let's hear this from another angle - what does it take for a
system to be 64-bits, in your amazingly insightful opinion? It has to
have 64-bit address bus, 64-bit data bus, 64-bit registers? How about
64-sides? how about 64-bit wide instructions? How about 64 angels
dancing on the head of a transistor?

>
>Hewlett Packard don't claim their HP-PA Risc architecture is a 64bit

>They don't go prancing around saying "256bit power coz we get a 256bit
>data bus!"
>

They also don't make video game systems - that is a mucho different
chip for a wildly different range of applications.

The chip doesn't have a 256-bit data bus, why would they claim such a
thing?

You do realize the difference between a 64-bit path from the on-chip
cache to the innards of the chip, and an external 64-bit bus shared by
many chips, right?

>So, how big are the registers in the Jaguar's Tom and Jerry chips?
>

Only 32-bits, of course - it would be foolish to make registers in a
game machine larger.

>Now Atari throws some marketing fluff about "64 bit system" and all

>"Advertisements shall be truthful and shall not be misleading or
>deceptive" clause. NB. These ads were for their ST range of
>machines.
>

I see you have conveniently forgotten to mention further details -
Atari AUS (independently of Atari US) ran an advertisement a few years
ago comparing an Atari ST and a CBM machine,with all sorts of
incorrect and misleading info about both machines. This has nothing
to do with the Jaguar, much less Atari US.

Has Atari US, the company, been scum in the past? Yes.

Has Atari changed for the Jaguar? Yes.

Thankfully the US does have truth in advertising laws, which is why
they can advertise the Jaguar as a 64-bit machine.

>Does Atari even have a design and verification process for their

You probably get all of that data if you are a developer, and are
willing to sign an NDA. Why should they give out company secrets to
anyone that asks? it might be nice for us, but it certainly does them
no good.

>
>Or they so featureless that they approach ASIC-like processors,
>performing simple deterministic tasks?
>

They spent a number of years developing the RISC chips in the Jaguar.
And for your benefit, I'll let you in on a little secret - ASIC's can
be quite complex, and reduce costs a bundle. The 3DO is moving this
direction with new chipsets. All us non-developer types know is that
some developers seem happy with the chips... and that none have
complained about floating point exception errors. :-)

>And before you say, haha, Atari don't make mistakes. How would
>Atari know without running lots of bizarre instruction sequences

>Do they make Motorola perform full fault coverage during the
>manufacturing process?

Probably. My games haven't crashed yet... And don't you think, that
after a number of years of development, that they might have some idea
what happens when you divide by zero? Don't you think Motorola does
some quality control on the chips they produce?

>

But it does that by reading data off of the bus in consecutive clock
cycles... faster than seperate loads, but still not all in one clock
cycle!

In one clock cycle, the Jaguar's RISC chip can load two 32-bit
registers. In one clock cycle, the blitter can manipulate two 32-bit
data items, or four 16-bit data items (for 16-bit color stuff).

Well, the graphics will be displayed... or perhaps the blitter will
move the graphics, or perhaps the DSP will do some sort of DMA
graphics. All of these things operate on a 32-bit bus.

>|> You are trying to
>|> apply game system logic to a computer, which I myself do not do.

>graphics machine too?' Or is it '16-bits' for graphics and '32-bits'
>for running programs that get a benefit from its cache? It's THE SAME
>LOGIC, Kendall.
>

It is 16-bits for stuff running from the CPU, but it is pretty safe to
call it a 32-bit machine because many componets operate on a 32-bit
bus. It's a bit more marginal than calling an A1200 or CD-32 a 32-bit
machine, but still there.

The logic behind my idea is not thesame from game system to computer,
and cannot be transferred. A game system has a much different task
set than a computer, which has a much more general set.

Great, now explain to me how this can be done over a single 32-bit
bus. Or does it some how read some stuff from fastmem, and some from
slowmem (whatever the name is).

The RISC chip in TOM also has a 64-bit data connection, and can do
64-bit reads and writes. That is a processor.

Cmon, please stop trying to drag the bloody Falcon into this!

You forget that loads take a few cycles - the way burst mode type
stuff saves time is that data is read from memory in CONSECUTIVE clock
cycles - not in the same clock cycle!!

There you go again. Reality check.

IF the chip in question has only one 32 bit data bus connection
THEN it can only do ONE 32-bit access in a memory cyle, whether it be burst or
random access. It certainly cannot do TWO 32-bit accesses in one clock cycle.

IF you know how to do this, you're going to be very rich, VERY rich.

Honestly, read up on processor design. Check out the definition of clock
and memory cycle. They are not the same. A memory cycle can take up to 8 clock
cycles with slow ram. The fastest possilbe is one clock cycle.

>Blitter != processor. Video shifter != processor. A processor runs programs,
>understand?

I have necer heard of a FULL 64- bit processor. Instructions dont need 64-bit for
encdoding, too much redundancy. As for data...

The poin is that you continue to state that the CD32 and its AA, or AGA chip
set can transfer 64-bits on a 32-bit bus in one clock cycle. It has a burst mode
probably. Dont throw tech specs around the place if you cant interpert them.
>|> Look. They may be able to do two loads in the time it usually takes to do one

>(BTW, is this the right time to point out the 16 bit bus on the Falcon?)

Whats the problem. Your lovely shifter chip DOES access memory locations side
by side. Maybe serial was a bad expression. Contiguos would be better. I,m
talking memory locations, not data. Serial addresses, by my understanding,
are a different animal to serial data.

BTW, the Falcon has a 32-bit bus. 68000 accesses memory through 16-bits.

Not quite. SVHS is just a standard for a video recorder. It implements
s-video for connection to other s-video devices. It has nothing
what-so-ever to do with audio.

!!!!!!!!!!!!
Raist! You obviously know nothing about the Falcon, in *ALL* modes upto
and including 256 colour mode the display is made from BITPLANES!!! OK???
The only mode that uses 'chunky pixels' is 16bit colour mode ?
Your lack of knowledge astounds me! Even the ST has bitplanes.

NO! masking is NOT required, did you actually read what I wrote?
The reason you DO NOT require masking is because the colours are set in
such a way that when the different playfields combine you get the first

playfield showing through the 'background' colour of the second . I.E.
TRANSPARENCY. THINK ABOUT IT!

Can't you get it into your head that the Falcon uses Bitplanes for everything
except 16bit 'truecolour' mode?
You obviously need educating.

>|> the only advantage of the amiga is that you can scroll each playfield

Why doesn't it sound right? The Falcon blitter can move memory at about 80k
per vbl and shift the data at the same time, so moving a 32k (320 * 200) 16
colour screen will take a little over 1/3 of a vbl.

>your problem?

Yes in 320 x 200 mode the CD32 suffers 3 times as much contention as the Falcon.
I'm sorry but I have both machines and have done timings on both.

Yes at YOU Raist! for not evening understand the most basic of bitplane
techniques.

Griff

PS. Will some Amiga person explain to Raist the concept of Bitplanes and
overlaying graphics in different planes.

I could be wrong here, but doesn't the Falcon have a 32 bit bus and the 68030 just have 16-bit access to it? Otherwise how do the other processors have full 32 bit access to memory. If so then it is very similar to the Jaguar and both machines are appropriately labeled.

>I have made no "wild claims" for the Jaguar (pull one up, please).

Well, the 64 bit processing for one. Not to mention hyping a non existant cable tv add-on and going on continusously about a cd drive that doesnt yet exist either.

>>
>> ATARI ARE A REALLY CRAP COMPANY.
>>

>No, the management hasn't been so hot (thoguh they actually seem to
>have seen the light). Atari workers put out a great product.

`not been so hot`! Ho ho, what an understatement! Over the last few years Atari has been an unmitigated DISASTER, they havent had a single sucessful product since the 2600VCS!!!!!!
5600 dead
7800 dead
ST dead
Lynx dead
Falcon dead

Despite having some good products, they have persistantly mis-marketted and mismanaged support, leading to the premature death of the product EVERY time.

>Yeah right, do you really think the Saturn will be out before this
>XMAS? Now who has a loose grip on reality. Remember - Microsoft is
>doing the OS!! Ha Ha Ha Ha Ha!! That ought to put an end to any
>speculations of a '94 release.

its no more unlikely than the Jaguar making it it out for last Xmas (it did, just about, but not in numbers). In fact, I`d say its a hell of a lot more likely since Sega have much more economic muscle and a solid backgrouind in arcade technology, upon which the Saturn is supposedly based. Even the prospect of it being out, will be enough to dissuade most potential buyers from getting a Jaguar, which of course is why Sega are talking about it now. The 600K/sec CD drive at the same price as a jaguar sounds mucho dodgy to me though.....

>CBM is dead in America (the small off-center booth at CES shows they
>have no wuill to capture the AMerican market). I have no doubt they
>will survive, though, driven by the Dark Side Of The Force and a
>bitter hatred for Atari (Well, that plus euorpe... :-))

Whereas Atari are thriving with a solid line of successful products???? They dont even have a good European marketplace to back them up. I`d say a bit of deft maneuvring from Sega and Nintendo could leave Atari very precariously placed.....

>traveled at one time - answer for the fans at home - it never did.

Working with 64 bits of data a time by pulling them over a
64-bit bus is NOT the same as PROCESSING them in 64-bits at a time,
which is what a 64 bit processor is supposed to do.

Thats why its called a PROCESSOR (a tech term ;-))

Some parts of the AGA chipset have 64-bit wide internal busses, that
doesnt make them 64 bit, and noone has ever claimed it did. It does
have 64-bit dma via bus sharing, and is muich more efficient than
the 16 bit DMA of the ECS chipset, offering 4x the throughput as you
would expect.

>> When I pointed out that the `64-bit` and `Multimedia` claims
>>were largely just stupid hype last week, the usual barrage of claims
>>from the space cadet Atari advocates followed.

>And thants because your claims are baseless. Of course it doesn't
>have 64-bit internal registers - what a waste! It has 64-bit data
>transfer, which is what matters.

I`m glad to see you think that bus width matters. During the
debate about the *16 BIT* CPU bus on the Falcon (anyone remember
that machine?), you and other advocates claimed that the reduced bus
width didn`t affect performance, and that since the PROCESSOR was 32
bit, it justified the 32 bit tag.

Of course a 64-bit bus is a mucgh better bet, but it doesnt make
the machine a 64 bit machine. Its the amount of bits that the
machine can process at a time that counts, and the jaguar is firmly
32-bit in this department. (or even 16 bit, since the CPU , and the
article by the Jaguar designer called the 68000 the CPU, is only 16
bit).

I seem to remember that you claimed that the RISC chips in the
Jaguar were in fact true 64-bit processors, care to take that claim

back??

AFAIK, the Pentium is the only widely available 64-bit chip to the consumer.

>> Let that be a lesson to those in this group who blindly (and >>STUPIDLY) advocate anything that Atari say or do. When will you face >>reality and examine ALL the FACTS about the systems you so foolishly >>advocate???

>You must learn to face reality yourself. The days are gone when a >system just has one CPU. The Jaguar is primarily a 64-bit machine >where it counts, and that is why it is so valid to say so.

Let me see, 16 bit CPU, 16 bit sound/32 bit DSP, 32 bit RISC gfx chip. 64-bit bus though... Where it counts is in the chips that do the processing and these are definitely 32 bit at most. Still, thats not to say the system isnt capable, just that its not quite the Amazing next generation 64-bit console that Atari advocates try to hype.

>Plus, it sure helps the marketing!

Which of course is why Atari push this lie. I`m surprised to see that so many people are prepared also to try and push the bullshit too, i guess they are just desperate for an Atari success.

I tihnk you are letting your surprise at Ataris sudden discovery
of marketting techniques go to your head. I will be very surprised
if they show anything like the skill of Sega or Nintendo. Moreover,
to market you need money and the last I saw, Atari didnt have a lot
of it. Maybe they have learned from their many, many mistakes since
the VCS, but I doubt it.

The fact that the Jaguar wasnt out in force for the last Xmas
season was a *Major* screw-up. Atari missed a lot of potential
sales, and have given Sega a chance to weigh in with the promise of
the Saturn for NEXT Xmas, to compete with the Jaguar in the years
biggest selling season.

>Also, the Lynx is coming back - after all, if Nintendo can sell
>billions of that lame green machine, Atari can certainly sell a lot of
>Lynx's when backed by Jaguar units.

After years in the console wilderness? I`ll believe that when i
see it.

>Oh, also, the Falcon is not a flop - as much as you'd like it to be.
>But this has been argued endlessly, so I won't go into more detail.

by most objective standards it is. It has a very small user base,
limited support and little in the way of developement done on the
design since it came out (certainly NOTHING has been done by Atari
on it). I`m sure that its owners may be happy with it, but its still
a flop and thats a FACT, something which Atari advocates dont seem
to know the definition of.

Oh yes, its a fact that companies will tell lies in order to hype
their products. What I dont like to see is a bunch of Atari
advocates on this group propogate these lies in order to try and
score points. A debate is supposed to be based on the facts, not on
spewing out untruths. I make no apologies for disseminating the
truth from the 64-bit lies, hopefully it might be of help to people
trying to find the truth about the various systems.

As for the ``now you can't tell me that two different 32 bit RISC
>chips can't work on 64 bits (combined) at once`` line, I cant
believe that still insist on coming out with bullshit statements
like that! What a lame argument.

[usual Jaguar tech specs deleted]

>> So in other words, the Jaguar does NOT have a 64 bit processor.

>No it doesn't. Atari never said there was one.

For christs sake! It says 64-BIT on the box. By all reasonable
accounts, this entails that it has a 64-bit processor. Of course,
reason is in short supply in this group.

>>It just does some memory transfers along a 64 bit bus. It is
>>inherently a 32 bit design, but can do 64-bit transfers in certain
>>parts of its architecture, just like the AGA chipset in the CD32.

>Bullshit. Does the Cd32 have a 64-bit bus. NO.

No it doesnt, nor does anyone claim that it is a 64-bit chipset.
What it does have is some internal 64-bit data paths, and a facility
for doing 64-bit dma via bus sharing, not that that is important to
this debate, since it was about Ataris false 64-bit claims for the
Jaguar.

>The majority of work done on the CD32 is done in 32-bits.
>The majority osf work done on the Jag is in 64-bits.

Look, I`ll spell this out nice and simple.

The most bits that are processed at a time are 32. All that
surface mapping and shading is done using 32-bit processing. It
would appear that the blitter can move 64-bits at a time, but that
is just shifting memory and not processing. Do you think that
surface mapping and gouraud shading is done by a blitter - NO. Heavy
processing is done in 32 bits. A 64 bit bus makes for efficient
memory xfers, and better performance, but it does NOT make a system
64-bit.

So, the majority of work done on the Jaguar is in 32 bits.

IS THAT SIMPLE ENOUGH FOR YOU?

>When Atari say they have a 64-bit system, they are right.
>I see a 64-bit bus. I see 64-bit graphic chips. I see a 32-bit chip
^^^^^^^^^^^^^^^^^^^^^^^^^

WHAT 64-BIT GRAPHIC CHIPS? HAVE YOU READ THE TECH SPECS???

here they are again....

The RISC processors manipulate 32 bit data as this is all the precision they need. They have 32 bit ALUs and 32 bit address generators. They can perform 64 bit transfers on the main bus if they need to, but not many data are this big.

OK? The gfx chips are 32 BIT
Got that????

>well interfaced to the 64-bit bus. I see a 64-bit system. You
>see an Atari console, and you look no further.

You see what you want to see. Youve already got the facts wrong twice in the same post. You look no further than hype and hope, which is all you advocates seem to have.

The Jaguar MIGHT succeed, it has GOOD specs and a VERY GOOD price.

However, ATARI are marketting it, which is always a bad point. In addition, software support is poor and this has always been a crippling factor in Ataris past ventures.

It has a chance of making it, but with Sega in particular firing its big guns, its future is by no means guaranteed to be as rosy as many poeple are painting.

A potential purchaser should weigh this up, and be aware of this in any purchasing decision. To blindly push out a line of the sort that people in this group have been doing is stupid, and potentially costly to an uninformed reader. I`m simply pointing out LIES which are being spread here.

My advice, wait a few months and see how the Jaguar support lines up. Chances are that most people will wait till next Xmas since that is when the main buying season is. By that time, things should be a lot clearer.

see my previoius post.

>The 68020 can do 32-bit fetches over a 16-bit bus, but this does not change
>the fact that it makes 16-bit fetches to memory.

The 68020 in the A1200 does 32-BIT fetches to memory (unless you
plug in some lame Falcon-style 16 bit ram ;-)).

Maybe you are thinking about the 68030 in the Falcon which has
only 16-bit access to memory.

Mark, more FACTS please,
less BULLSHIT.

Have the grace to admit when you are WRONG instead of wildly
thrashing about.

>You're in the wrong newsgroup ... try rec.games.video.advocacy .. where Jaguar
>developers several times has stated the Jaguar as having both 64 bit chips and
>a 64bit bus ..

ah, Rickard! I wondered when you would put in your typical bogus
claim. maybe you should read the article in the post which was from
one of the main desginers of the Jaguar in a magazine interview
saying that the RISC gfx processors where 32 bit, but on a 64 bit
bus. Still, you have an excellent protege in Mark P Nolan who seems
to be every bit as full of bullshit as you are, and is just as
unwilling to admit he is wrong when he is inevitably caught out.

>How come you can't get net.access on your own, but has to use other people's
>accounts?

I have net access via NYX, but this is very slow and cumbersome.
In addition, I am presently accessing the net at my old university,
and so must go via another account anyway. So it makes sense to use
that account to do the email sending (via the UseNet mail to news
gateway) as the mailer is much better.

I have an account on my new postgrad course and hope to soon be
able to use this to access the InterNet, but my new University are
real bastards when it comes to giving InterNet access, so it is
taking time and I use friends accounts, who are at my old university.

>apply game system logic to a computer, which I myself do not do.

Oh right! So games consoles which use microprocessor chips obey
different laws of physics than computers? Obviously the keyboards
and disk drives must somehow warp the flow of electrons.

This is all about the 64-bit claim for the Jaguar.

A lie.
A piece of hype.

And you seem determined to push the lie, even though the truth
stares you in the face as said by an Atari designer. Dont you EVER
check the facts before you rant on. I can take Atari lying, but when
someone keeps pushing lying hype despite the facts then I get really
pissed off and make posts like this.

Now you are trying to wriggle out of it, as is usual.

Repeat after me...

THE JAGUAR IS **NOT** A 64 BIT MACHINE.

it does NOT have a 64 bit gfx processor.

Is that better?

No... only chunky pixels for true colour mode. It has the best of both
worlds.

> And about the ST- the ST doesn't have bitplanes. Talk about lack of
>knowledge.

YAWN.... The ST has four bitplanes in 320*200 mode.
two bitplanes in 640*200 mode.
one bitplane in 640*400 mode.

Where do u get your information on the ST from? Ive been coding games
and demos on the ST for years... I'm well known for it.
the bitplanes in 16 colour mode are arranged as follows:

word 1 bitplane 1
word 2 bitplane 2
word 3 bitplane 3
word 4 bitplane 4
word 5 bitplane 1 (next 16pixels)
word 6 bitplane 2 (etc)

you really ought to think before you post.

>|> >|> IN THIS WAY, THE SECOND PLAYFIELD IS OVERLAYED TRANSPARENTLY JUST LIKE

Wrong.. it gives precisely the same effect as a dual playfield.

The falcon can move 80k in 1/50th of a second.

> [lots of silly meaningless calculations deleted]

so the Falcon can copy a 16 colour (32k) screen in a little over 1/3 of
a PAL TV frame. (i.e. full bandwidth is about 4 meg/s)

>|> Yes in 320 x 200 mode the CD32 suffers 3 times as much contention as the Falcon.
> Yawn. We are talking about the A1200 and the CD-32 doesn't have that

I asked several amiga owners and the reply was "what is Raist talking about".
why is the CD32 different, what magic does it employ to get rid of the
contention. The a1200 is badly crippled in high colour modes and YOU know it.

>|>
>|> >|> Griff (sounds of loud laughing at Raist's ignorance)

Well your wrong the ST does have bitplanes, always has done.

> Someone in the know cares to comment? (about the Falcon)

I think I am "in the know", ask any of the amiga games companies I've worked
for. The difference between me and you is that I only express opinions

about stuff I have experience with, you obviously have no knowledge of the Falcon or ST h/ware, so how can u argue about stuff that you NOTHING about.

Griff.

|> >The Falcon DOESN't HAVE bitplanes... or did some Atarians here posted
|> >false specs about it then?
|>
|> NO! masking is NOT required, did you actually read what I wrote?

Yes, but there's still something wrong...

|> The reason you DO NOT require masking is because the colours are set in
|> such a way that when the different playfields combine you get the first
|> playfield showing through the 'background' colour of the second . I.E.
|> TRANSPARENCY. THINK ABOUT IT!

Spare me the 'superior tone' ok? This is what Scala does on my machine
for a transparency effect called 'SuperImpose' (Scala guys call it that
way in their software).

|> Can't you get it into your head that the Falcon uses Bitplanes for everything
|> except 16bit 'truecolour' mode?
|> You obviously need educating.

But for some very strange reason, you are the FIRST person in MONTHS here
to mention that.. Hmm......

|> >|> the only advantage of the amiga is that you can scroll each playfield
|> >|> independently. On the Falcon to scroll both you scroll one with the
|> >|> h/ware scroll and blit the other one. But this takes only 1/3 of a vbl,
|>
|> > 1/3 of a VBL? Hmmm..... doesn't sound right.
|>
|> Why doesn't it sound right? The Falcon blitter can move memory at about 80k
|> per vbl and shift the data at the same time, so moving a 32k (320 * 200) 16
|> colour screen will take a little over 1/3 of a vbl.

Is that VBLANK or is that per Frame? 1/3 of a vlb.. Hmm....

Let's see:

If you have a 1-bitplane screen (assuming the Falcon has bitplanes,
which I doubt highly), 80k of data is 80k * 8 worth of bits ~= over 640,000 pixels
in just 1/3 VBL.

Now, 640,000 * 3 = 1, 920, 000 million pixels. And that's just on VBLANKS!
You got something wrong with your timing. Maybe you meant PER FRAME.

|>
|> >|> and u then HAVE no need to restore BOB backgrounds which in a game
|> >|> with a reasonable no. of bobs would take this amount of time anyway.
|> >|>
|> >|> PS. In 8 bitplane mode, The falcon suffers only 20% video contention.... I think AGA
suffers about 60% contention without fastram when displaying dual-playfield, so the

overhead of the blitting is even less important,esp. when u consider
|> >|> that all CD32s have no fastram.
|> >
|> > But they don't suffer from bus contention in 320x200 modes... so what's
|> >your problem?
|>
|> Yes in 320 x 200 mode the CD32 suffers 3 times as much contention as the Falcon.
|> I'm sorry but I have both machines and have done timings on both.

Yawn. We are talking about the A1200 and the CD-32 doesn't have that
video contention you are talking about. Not as VIDEO bus contention though.

|>
|> >|> Griff (sounds of loud laughing at Raist's ignorance)
|> >|>
|> > Really? I think more people will laugh around here than you might

|> and both machines are appropriately labeled.

No, because using the Jaguar logic, since the memory transfers to/from
CPU's is 'what counts', the Falcon would be 16-bit since the CPU doesn't
have 32-bit access. The graphic chips, while 32-bits, are used only for
displaying the image from memory- a job done by every single 'graphics chip'
I know of, and the blitter.

I guess the Falcon is like a '68030SX computer' ;-)

Gavan, actually, ATARI said '64-bit architecture' not actually
'64-bit CPU.' But what's even more interesting is how some
atari advocates take that and magnify it by two so they get their
64 bits 'CPU.'

|>

Gavan, after re-reading the ATARI engineer quotes, the blitter
seems to do the Gouraud shading. He didn't mention texture/surface mapping
though.

I agree with you Gavan. He was MONTHS AGO to try the 'BURST MODE'
of his Falcon computer... he hasn't said a THING since then about that.

(for those reading this that don't know: Rickard was claiming he
could do a burst mode using his Falcon's 68030. The problem is
that Motorola requires special memory configuration plust a 32-bit
bus to do that).

Well, no. Someone asked me if I knew what a clock cycle was, so I put down that I do, and my qualifications for knowing that I do. Hardly fascist I think.

I have been reading 64, no 64 articles....
Gee, I didn't know people would be so serious over a game machine..
(No, it's not just a game machine...hahah, yeah, right!)
I was wondering if Atari is reading this newgroup and
cares to respond at all?
To me, frankly, Atari machine has a lot of potential..but
obviously it needs better games...
and for 3do, price...well, price...
as we all know a superior technique does not necessarily mean a success
(like Motorola vs Intel at the birth of PC)
(and Amiga...what happened?)
(also a lot of people preferred 8bit sega over NES but not that many actually
bought 8bit sega machines....)

>before? ;-)

That's SLU ASPIKS, who says HI RAIST DOODOO MAN!! from his cage. :-)

>Ah, when you bought your Jaguar... ;-)

Around January 3rd, in New York City. Believe it or not, the Electronic Boutique in Memphis, Tennessee (60 miles north of here) got some in, but sold them on the first day. There is quite a bit of pent-up demand for the things around here, amazingly enough. I have brought it to the CS department a couple of times (so that we could "evaluate" new technologies, of course :-) and have had guys walk by and say "Whoa! Where'd you get a Jaguar!" and that sort of thing.

>|> Sheesh, you guys act as if Kendall is the person responsible for the
>|> whole 64bit thing.
>
> Nope, not my case. But I think he's more reasonable that some Atarians
>I have seen around here. I don't think he's the one responsible.

I've never considered myself an Atarian, and I still don't, but I guess I am a Jaguarian of sorts... ;-)

>|> I've got some rope and know of several trees that
>|> would be suitable, if that would make y'all feel better. ;-)

>while we watch? ;-)

If you'd like. Or even better, we can hang SLU up and watch him untie the knot using his toes.

>|> Oh come on now, it's just marketing hype, something which has been
>|> proven to sell things. If you guys want to insist on complete truth

>|> in marketing and advertising, don't you think that all companies and
>|> their products should be held to the same standard?
>
> Yep.

That's going to drastically change the entire face of advertising,
don't you think? I mean, does anyone really believe that cars can
run at 80 miles per hour without upsetting champagne glasses on the
hood? Or how about that SoloFlex thing? I've got one, but I sure
as hell don't look like the dudes on the commercials... Hey! They
can't advertise stuff like that! I know that they don't work! :-)

>|> BTW, the comment above about the HP's 48bit address space brings up
>|> a good point. The CD32 has a 68EC020, right? Doesn't that chip have

>|> Commodore be similarly chastised for claiming that the CD32 is a 32bit
>|> machine? Wouldn't CD24 be more appropriate?
>
> Ok, you got me with the HP one... but you know the difference.

Actually, I'm just picking nits there to make a point. It's a bit
silly to try to classify any machine as being Nbit anyway. I've got
a 32bit VLB SCSI-II adapter, but it's connected to a standard SCSI
drive, which is a mere 8bits. I still consider the board to be a full
32bits, but I know good and well that the drives that are most likely
to be used with it will only be 8 or 16bits at best.

One thing that I'd like to see is a real test of how fast these
systems can blast pixels onto the screen. The number of bitplanes
should be at least 8 and the resolution at least 320x200, and the
tests should be for writing pixels, lines, and blocks of pixels
onto the screen. Quotes like "850 million pixels per second" and
"64 megapixels per second" don't mean squat without some sort of
qualification. The thing that gets me is that even at a "full"
768x576 overscanned PAL resolution at 25fps or 768x482 overscanned
NTSC at 30fps, you're only talking about 11 million pixels or so per
second. From what I've seen, read, and heard, none of the current
systems are even approaching these sorts of numbers. In fact, at
the more typical 3XXx2XX resolutions, the number of pixels per
second is substantially less than even the "mere" 7 million pixels
per second claimed for the CD32.

>|> That may well happen, but somehow I bet that Nintendo, Sega, Atari,
>|> Commodore, Panasonic, Sanyo, Philips, etc. will try to fight it. You
>|> have to remember that these consoles are all consumer items, not real
>|> computers.
>
> True.

So far, the CD32 appears to be the only console that is really
suited to becoming a full-fledged computer. The others may have
the potential, but they won't have any sort of installed base of

software and hardware that can compete with the Amiga/CD32. Sure,
some will say that there may someday be 3DO adapters for the Mac
and Clones, but that's not the same thing. The key is going to be
whether or not people actually value this capability and factor it
into their decision.

>|> The average Joe and Jane Sixpack are going to buy them

>|> are to truthfully marketed and advertised, other appliances should be
>|> as well.
>
> That still doesn't justify hype. I attempt hype-fighting no matter
>what. This is why there are consumer-products reviews, right?

Sure, and I'm all for those groups, especially the ones like Consumer
Reports who have no affiliations. Hype is something that's going to
be with us no matter what though, I mean look at all of the hype about
the SegaCD, sheesh, talk about a crime. I've seen the SegaCD games
and they are absolute crap! The "video", and calling it that is
really stretching it, is awful, and the gameplay falls into the
same realm as those stupid PC games where you really aren't doing
anything but choosing among options designed by someone else.

>|> One thing that I can't figure out is why anyone cares how a company

>
> Did you know that some of those protections have come to exist
>because of people that have fought hype before?

My feelings about this stem from my beliefs that less government
would do us all a lot of good. I won't get into that here, other
than to say that every new law restricting what we can say bothers
me. I may not agree with the hype and in fact often don't, but I
can't see where the line is going to be drawn once we begin to
place restrictions on those we don't agree with.

>|> Sounds like HP and Commodore will make a perfect match. ;-)
>
> He he he... That's a good one ;-)

After what I have read, I am now expecting to see the AAA Amigas
this fall and the AAA CD32 by the next Winter CES. After all,
David Tiberio said that they'd be out.... ;-) Oh, and the
Amigas will have "A5000" stickers covering up the "Gecko" stickers,
right? :-)

The Jaguar is not a 64-bit machine. I believed Atari derived that by adding the number of data lines going to the CPU and some of the other custom chips. A little mischevious if ask me.

Of course, I finally came to my sense after being ripped off by what can best be described as Jack's hobby company for 10 years. I woke and I am glad I did!

I am not quite sure about the 256 colour mode, IMHO it's chunky, but the 4/16 colour modes are definitely bitplane modes.

> And about the ST- the ST doesn't have bitplanes. Talk about lack of
>knowledge.

Yeah, and all these colours while scrolling within the text editor in 4/16 colour modes are caused by chunky architecture, right? And that's why many demos got 1 bitplane scrollers, because these modes are chunky, right?

>accounts, this entails that it has a 64-bit processor. Of course,
>reason is in short supply in this group.

Oh dear. Look. It says "64-bit system". Nothing wrong with that.

If you place a 64-bit bus, and 64-bit graphic chips into a piece
of hardware, no mean feat, then you are going to tell people.
There will always be those that will nag nag bloody nag all
their miserable lives at anything you do or say simply because they
like to, or they own a competing piece of hardware.

I havent even seen your .sig, but I can bet you own an amiga, or
a 3D0.

Atari dont state they have a 64-bit processor, they state they have
manafactured a 64-bit system. It would be ludicrous to ignore the
fact when marketing the machine.

You are the same people who nag about
Atari's poor image and low sales, BUT when they try and make something
of a machine, the same bloody assholes come out of the wood work and
like experts, tell Atari their 'wrong', 'stupid', or simply 'doomed'.

Get a life. Get a Jag. :-)

>>>It just does some memory transfers along a 64 bit bus. It is

>surface mapping and gouraud shading is done by a blitter - NO. Heavy
>processing is done in 32 bits. A 64 bit bus makes for efficient
>memory xfers, and better performance, but it does NOT make a system
>64-bit.

Just like all the arguments against 'poor, stupid' Atari, they're
bleed'in full of paradoxes!

Yes, you are correct when saying that most work is done on graphics
in 32-bits at a time. The 'pixel' is a 32-bit entity.

However, the RISC chips that accomplishes these 32-bit ops, grabs
them 64-bits at a time from memory. It can load 2 32-bit regs in one
load cycle. From an internal point of view, the data is operated on
in mostly 32-bit segments, BUT you cannot get away from the fact
that most time in a system is taken up with i/o. It is the
bottleneck.

The data in the 'system' is mostly OPERATED on in 32-bit chunks (
not always), but moved about in 64-bit segemsts. The point is that
most work, ie i/o and other operations available, are done with
64-bits. FACT.

Now get off your bloody high horse, and have some coffee.

Do you have a life to go to, or do you spend your life arguing?

> So, the majority of work done on the Jaguar is in 32 bits.
> --

Wrong. see above.

Define 'work' plese, I'm confused!

> IS THAT SIMPLE ENOUGH FOR YOU?

no. It's a blatant lie.

>>When Atari say they have a 64-bit system, they are right.
>>I see a 64-bit bus. I see 64-bit graphic chips. I see a 32-bit chip
> ^^^^^^^^^^^^^^^^^^^^^^^^^

> WHAT 64-BIT GRAPHIC CHIPS? HAVE YOU READ THE TECH SPECS???

The blitter. The shifter....

>here they are again....

I know the feeling..

No 256 colour mode is a bitplane mode.

I wish the Falcon could display it as a byte per pixel though, since it is
a better compromise than 16bit True Colour mode (which is a little much for
a 68030 to update). A byte per pixel would allow even faster texture mapping
and gouraud/phong shading ... not that my routines are slow using 16bit colour
or anything ;-)
The latest technique on the Falcon is to draw in a byte per pixel screen and
then use the DSP to convert to bitplanes, I think this is a trend in amiga
demos at the moment, however the amiga doesn't have a DSP, and the falcon DSP
can do it rather more quickly then any 030/040 ;-) .

Yup, Raist was living in a dreamworld if he thought the ST didn't have bitplanes, however we are here to educate him anyway ;-)

237. Who's Who in the Atari Community (e-mail list)

Newsgroup: comp.sys.atari.advocacy
Date: 1994-02-01 17:44:38 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <2im4e6$rn7@usenet.INS.CWRU.Edu>
Source record: 19279
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

Who's Who in the Atari Community

The Cleveland Free-Net Atari SIG is compiling a list of people that are members of the Atari Community that do things that help Atari users and the Atari Community in some way on a continous basis. They are Atari BBS sysops, dealers, developers, publishers, user group presidents, writers, FAQ maintainers, etc. They are even Atari employees.

Unless you send us your name, e-mail address(es), and information on what you do in the Atari Community, you will not be included on this list.

We will not say that "John Smith" should be on the list and then find his e-mail address and then put him on the list. ONLY people that have given us permission by sending us this information will be on the list.
If they do not, we will assume that they do not want to be on the list because of privacy reasons.

If you contribute some way to help others in the Atari Community on a continuous basis and would like to be made more available through e-mail incase someone wishes to contact you, please send e-mail to the Cleveland Free-Net Atari SIG at: xx004@cleveland.Freenet.edu

Everyone included on this list will be arranged in alphabetical order.

Again, the only thing you need to do to be on this list is to contribute in some way on a continuous basis to the Atari Community.

This is a serious list which should help everyone in the Atari Community communicate better with one another.

Please remember to send us your name, e-mail address, and what you do in the Atari Community. Any additional information that you include is for the benefit of the users of this list.

Thank you.

Len Stys, SIG Manager
Cleveland Free-Net Atari SIG

|> one bitplane in 640*400 mode.
|>
|> Where do u get your information on the ST from? Ive been coding games
|> and demos on the ST for years... I'm well known for it.
|> the bitplanes in 16 colour mode are arranged as follows:

In all the articles I read when the ST came out, there was NADA
about bitplanes in the ST. And they were doing heavy comparisons against
the Amiga.

|>
|> word 1 bitplane 1
|> word 2 bitplane 2

|> word 3 bitplane 3
|> word 4 bitplane 4
|> word 5 bitplane 1 (next 16pixels)
|> word 6 bitplane 2 (etc)
|>
|> you really ought to think before you post.

OH, yeah right.

Word 1.. bitplane 1, etc. That's not bitplanes, you know. That's kind
of a hybrid.

|>
|>
|>
|> >|> >|> IN THIS WAY, THE SECOND PLAYFIELD IS OVERLAYED TRANSPARENTLY JUST LIKE

|> >
|> > Yes, but there's still something wrong...
|> >
|>
|> Yes something wrong with your brain.

Aha.

|>
|> > Spare me the 'superior tone' ok? This is what Scala does on my machine
|> >for a transparency effect called 'SuperImpose' (Scala guys call it that
|> >way in their software).
|>
|> Wrong.. it gives precisely the same effect as a dual playfield.

No. I am not. They change the intersection of colors dynamically
to do the transparency effect. Here it differs from what you were saying
but I understand the technique.

|>
|>
|>
|> >|> Why doesn't it sound right? The Falcon blitter can move memory at about 80k

|> >
|> > Is that VBLANK or is that per Frame? 1/3 of a vlb.. Hmm....
|>
|>

|> The falcon can move 80k in 1/50th of a second.

Ok, so that's 50 * 80k means 4 megabytes of information which is
4 * 8 1-bitplane pixels 32 MILLION pixels per second. YEAH RIGHT, AHA.

|>
|> > [lots of silly meaningless calculations deleted]
|>
|> so the Falcon can copy a 16 colour (32k) screen in a little over 1/3 of
|> a PAL TV frame. (i.e. full bandwidth is about 4 meg/s)

Aha. Sure.

|>
|>
|> >|> Yes in 320 x 200 mode the CD32 suffers 3 times as much contention as the Falcon.
|> > Yawn. We are talking about the A1200 and the CD-32 doesn't have that

|>
|> I asked several amiga owners and the reply was "what is Raist talking about".
|> why is the CD32 different, what magic does it employ to get rid of the
|> contention. The a1200 is badly crippled in high colour modes and YOU know it.

Oh, I am very sure you asked them. Dude, you claim to be 'superior' and
yet you use non-logical arguments to support your conclusions. Like
"I asked several amiga owners...etc.". GEE, RIGHT NOW I ASKED 150 ATARI
FALCON OWNERS HERE AND THEY DON'T AGREE WITH YOU. Of course, you won't
believe me, but I swear on Commmodore's and Atari's logo that it is
super-true...

The CD32 and A1200 doesn't have bus contention in 8 bitplanes in 320x200
color modes.

|>
|> >|>
|> >|> >|> Griff (sounds of loud laughing at Raist's ignorance)

The CD-32 does it using the Akiko. And a '040 machine would be faster
anyway in general than the Falcon.

Okay, now that Weregoose mentioned it, I take it back. The ST has
'bitplanes' then. Not actually, since the word arrangement it has.

|>
|> Griff
|> --

I still doubt the Falcon's blitter capabilities. I guess when I see a
Falcon game WITH 'dualplayfields' I'll believe it.

Anyone in the know knows about this? (Someone who can explain without
insulting).

Yes the CD32 does the conversion with the Akiko, but are you really saying
that a 68020 at 14mhz can map textures or do Phong shading faster than a
56001!!!!!! hahaha

An 040 certainly cannot do a bitplane conversion faster than a DSP , YES an
040 is certainly a faster general purpose processor than the DSP, but for
anything to do with gfx it just cannot compete with a 56001 DSP, I have written
a phong shading routine for the Falcon DSP that can do about 400,000 phong
pixels per second.
The DSP 56001 can do a matrix multiply faster than a DX-66, perhaps you should
read a book on this chip, it really is *powerful* -> it can do a 24 bit
multiply and 56 bit add AND two 24bit parallel memory moves 16,000,000 times

per second. It has hardware looping and reptition of instructions. Think before
you post.

>|> >> And about the ST- the ST doesn't have bitplanes. Talk about lack of

What you admit you were wrong? Shocking.
(but why couldn't accept my opinion, remember I only speak about stuff
I know and have experience with, this is not the case with you, otherwise
you would not have to take anything back.)

Well if you say the arrangement means its not 'bitplanes' then your saying
that most Amiga games don't use bitplanes. One of the most common Amiga
screen layouts involves interleaving the bitplanes on each line, this
has several advantages like being able to BLIT a Bob in one Blit, rather than
need a seperate blit for each bitplane.
The same applies to the use of the Blitter with the arrangement of the
bitplanes on the Falcon.

>|> Griff
>
> I still doubt the Falcon's blitter capabilities. I guess when I see a

RH> 64 bits 'CPU.'

Open Jaguar.

Read the text on the chips.

Jerry is titled "DSP"

TOM is titled "CPU"

...

Tom contains 4 different chips, of which 2 use 64 bits .. (BLiTTER and GPU)

RH> I think the blitter of the Jaguar supports some minimal 3D stuff
RH> though Gavan. Like Z buffering. On the other hand surface mapping....

Gouraud shading
Texturemapping
Z-Buffering
Skewing
Rotating
...

Whatever .. the rotating, resizeable texturemapped 3D box appearing when you
switch n the Jaguar is done (according to the programmer, Eric smith) using
only 3 blits with the BLiTTER ..

RH> PS: I mostly agree with you Gavan.

We do feel sorry for you guys.

Just a side note here, it seems to me that the PowerPC Slayed the
Pentium in a speed test. Actually the pentium has been designed
poorly and runs at too hot a temperature. At least that is what I
heard (the Journal reported it).

It must be done in consecutive clock cycles - there is no way to get
double the bandwitch of a bus without Magic.

The Jaguar is not 64-bit's soley because of its bus, just as the
Falcon is not 16-bits because ONLY the bus from memory to the CPU is
16-bits. The Jaguar is 64-bits because of the many chips that draw on
the 64-bitness of the machine.

>|>
>|> You forget that loads take a few cycles - the way burst mode type

>In the doc's I have, it's refered to as Double CAS, so maybe it does some form of
>multiplexing or something.

Look - if you have 64-bits of data, and a 32-bit bus, the MINIMUM
numhber of clock cycles that will take to transfer is two. It will
take more if you do two 32-bit loads in a processor for example, and
will take exactly two in a burst mode type situation. You CANNOT
multiplex a whole 64-bits down to 32 and expect to get the whole
64-bits worth on info out again!!!!!!!!!!!!!!!!!!!!!

Really!!!!!!!!!!

Please, for the sake of sanity, everyone abandon the notion you can
transfer 64- or 96 bits in one clock cycle on a machine with a single
32-bit bus to transfer it across.

The 64-bit processing claim is no wild one - all of the graphics chips
operate on 64-bits of data at one time, over a 64-bit bus.

The only cable thing I have ever talked about are the possibilty of
cable boxes in the distant future, and Atari's hope to have an MPEG-II
cart (which would be nice). They already have Brainstorm (who wrote
MPEG and JPEG decoders for the 560001 DSP in the Falcon) working on
the MPEG cart.

Developers already have the Jaguar CD, it is not vapor as you claim.

Take a look at the Saturn specs someday - it is supposed to come with
7MB of memory, and a CD-ROm, plus 6 specialized chips - all for $500.
Microsoft is doing the Saturn OS. Now tell me it will be out in the
US before next year. Even Sega themselves are saying early next year
for US release.

All that aside, is the US market going to pay $500 for ANY game
machine? Just look at 3DO for the answer to that question - they
will, but not in the millions.

They have solid American demand to back them out. They sell out
almost all of the Jaguars they ship, and shipments to Europe have been
cut back due to high US demand. Futhermore, the Press just loves the
Jaguar, and CNN has the Jaguar on every now and then. They had a CES
booth that was right next to Sega and Nintendo, and won a number of
show awards for the Jaguar games and system.

Unlikely, as on an A4k/040 the bottleneck in c2p conversion is the memory access time. But I'll say it would be nice to have a DSP to do it. However, why not let your atari blitter handle c2p, and leave your DSP and CPU free to process.

It reads them in 64-bits at a time, then writes them out again -
that's "processing" 64-bits of information. Also, by your definition,
the blitter is a 64-bit processor as is does just what you described.
Thaks for the Jaguar support!!

>

INCORRECT!!!!!!!

I NEVER claimed that the performance was not affected by the
16-bitness of the bus, just that cacheing reduced such.

>
> Of course a 64-bit bus is a mucgh better bet, but it doesnt make

>bit).

The Jaguar can easily process 64-bits at a time - the blitter does so
through a the full 64-bit bus, doing g-shading and texture mapping.
The RISC chip reads and writes 64-bits at a time - internally it may
work on 32-bit registers, but for moving to and from the chip the
whole 64-bit bus is used. The Jaguar is rather more "solidly" 64-bits
than otherwise.

The 68000 is not the only CPU, you know... You Amiga guys must really
learn to catch up with the times.

>
>I seem to remember that you claimed that the RISC chips in the

>the processing and these are definitely 32 bit at most. Still, thats
>not to say the system isnt capable, just that its not quite the
>Amazing next generation 64-bit console that Atari advocates try to
>hype.
>

But almost all the data in a game will be moved 64-bits at a time -
bottlenecks in a system usually occur in the bus, and THAT is why I
say that it is reasonable to call the Jaguar a 64-bit machine.

>>Plus, it sure helps the marketing!
>
> Which of course is why Atari push this lie. I`m surprised to see

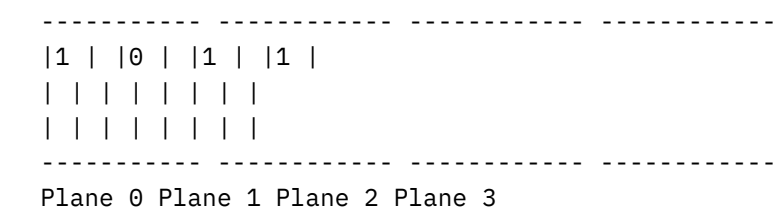
255. Atari Bitplanes (Was Re: CD32 in Popular Science!

Newsgroup: comp.sys.atari.advocacy
Date: 1994-02-02 01:49:57 UTC
From: whitema@rtsg.mot.com
Message-ID: <2in0s5$km3@delphinium.cig.mot.com>
Source record: 19149

Okay, Raist. I'm sitting here with "Compute's Technical Reference Guide:
Atari ST: VDI". They are talking about multicolor fill patterns. I
quote: "..for the purpose of muliticolor pattern fills, color bits are
grouped by what are called BIT PLANES. In such a grouping, the color bits
for a single dot are split up so they aren't contiguous the way they are
in ST display memory. Instead, all of the least-significant bits are in
one block, followed by a block of the next most-significant bits, and so on."
They go on to show how in a four bit plane set up, the most significant bit
is in plane 0, and the least significant bit is in plane 3.



The color above would be the color in color register 11. If you were looking
at the memory location where this color is at, you would see "1011".

Have fun!

Michael

Everything would be fine if you were spewing out truth right and left,
but you are just spewing usless data, and false claims that the Jaguar
is not a 64-bit system.

Tell us just what a system must have, in your opinion, to be a 64-bit
system.

I never have insisted on thios point, but you forget that ONE of the
RISC chips is 64-bit, not 32-bit as you spew forth.

A 64-bit DMA in concecutive clock cycles is not the same as taking one
clock cycle to transfer 64-bits of information - in fact, it must be
at least twice as slow using a 32-bit bus.

Yes it does - remember, that the limiting fasctor is going to be the
bus. So, after the memory transfers are done, those two 32-bit
registers can be acted on, then written out in the next bus cycle.

The Gourad shading IS done by the blitter, and at least one
trustworthy Atari engineer has stated the blitter does texture mapping
(the blitter was used to map the pictures of the Jaguar onto the
rotating cube in the Jaguar startup sequence). I suggest you take
another look at the specs, before you make such wildly inaccurate

claims.

Atari marketing so far has been excellent for the Jaguar - and they actually have hired an outside advertising firm for national Jaguar advertising. The developer list is quite good - it will take some time for titles from them to start appearing, but in a few months I see a much rosier software picture.

> It has a chance of making it, but with Sega in particular firing
>its big guns, its future is by no means guaranteed to be as rosy as
>many poeple are painting.

As for the Sega guns, yes they will hold on.... but the Sega machine will not see the USA until next year, and will cost $500.

I am not talking about laws of physics (which are the same, in case
you are confused on this issue).

Look, the Jaguar IS a 64-bit machine - the only real thing you can
contend is weither or not the Falcon is a 32-bit or 16-bit machine,
and that is a stickier issue.

As a matter of fact, if the Falcon is a 16-bit machine, then the
Jaguar MUST be a 64-bit machine. If the Falcon can be considered a
32-bit machine, then the Jaguar is a 64-bit machine. Is THAT simple
enough for you?

>
> This is all about the 64-bit claim for the Jaguar.

What makes the Pentium a 64bit chip???
The Pentium has a 64 bit bus, its internal Registers are only 32bit - it has the same 32bit registers as the 486 (EAX,EBX,ECX etc...), so unless it has extensions to these registers to make them 64bit (i.e. EEAX,EEBX ;-)) then the same logic that people use in calling the Jaguar a 32bit machine can be applied to the Pentiums too. The Jag is 64 bit, no questions asked, it has a 64bit datapath and thats enough for me... and *yes* I'm happy to call my machine a Falcon030SX.

The DSP can do it far more quickly than the Blitter, most stuff I write with
the DSP stores the screen internally in DSP memory -> at some point you have
to transfer the screen to CPU memory.
The DSP can convert the byte per pixel to bitplanes as fast as the CPU can fetch this
screen data from the DSP, so rather than just waiting around for the CPU
to fetch the next word, the DSP does the conversion and hence is more fully
utilised.
Oh... and the DSP does the MOD player on an interrupt .

Griff.

And nor did I ask you to make any apologies, even though I personally
don't see what you're screaming about. Try stepping out of your
"martyr" position and read what you just wrote. You have used words
such as "lies", "untruths", and analogies such as "scoring points", just
how am I going to score any points by backing a system that I like??
I'm not! Nobody out there cares that I support X or Y machine! The obvious
answer? I support Atari because I *like* atari. And if you don't care
too much for atari well that's you're problem, not everyone else's on
the internet. I WHOLE-HEARTEDLY encourage people to find out the
TRUTH about all the systems. I know that the truth (even if some people
claim otherwise) is that the Jag is a wonderful system, and I know that
if people take the time to look it over, they will see this too.

> As for the ``now you can't tell me that two different 32 bit RISC

I've seen Jaguar specs in different magazines, and it looks OK. I do believe
that the Jaguar has a 64-bit bus for graphics. They have not added several
less than 64-bit data paths to get this value. Gavin (Gavan?) and other
people who've been saying that the Jaguar isn't a 64-bit system are possibly
sane persons, but what would it take to make you convinced? Seeing the chip
design on silicon level?

It is a 64-bit system.

Anders Skelander

20,000 sounds about right, but the number is growing, albeit slowly and new s/w is coming out all the time. There are games, and quite aloyt of Atari ST s/w works so you can get these.

Also, the PD scene is pretty good.

At the end of the day, the more users of a system, the more likely a future and s/w base.

Sorry, but I would not lower my standards and attend an Amiga forum. You
will never see me make a post there (unless I eventually but an
Amiga....NOT!!!!).
Though, my response would be similar to those who go to an Amiga forum just
to trash the Amiga. They probably are Atari losers who feel a little bit
insecure, though only God knows why :-)

Well Raist, when I get somebody who can post an intellectual argument, then
I'll post an intellectual response. To this point most of the stuff that
Gavin has been posting is pure garbage, and like begets like.

You call this childish??....Maybe you ought to reread some of the garbage that is being posted here and then tell me this is garbage. I think I was being rather nice considering :-)

|> Department of Electrical and Computer Engineering
```

WHY DON'T YOU LISTEN!

the ST has bitplanes (well they damn well aint chunky pixels!) and so does the Falcon apart from in Truecolor where it has chunky pixels...

my idea of what this stuff means by the way...

chunky pixel: all the colour information for a pixel is stored togethor, the different bit planes making up a pixel are _not_ split

bit planes (well at least what an ST and Falcon have): In screen memory the first word stores information about the first bit of the first 8 pixels, the second word stores info about the 2nd bit of those 8 pixels... this isn't really bit planes I'd call it more interleaved or something. But it IS NOT chunky!

And hey if Griff (who I know does some damn good stuff on the Falcon) says it works using bit planes and manages to code stuff that uses it then perhaps we can assume that the falcon has bit-plane (ish) layout ? No ?

No, the Jaguar is a 64-bit machine in the same sense the the Atari ST, Amiga 500, Sega Genesis/Megadrive, and SNES are 16-bit machines, i e it has a data bus for graphics that is 64 bits wide.

Somebody argued that since the internal data processing is still 32-bit, the Jaguar isn't as good as it could have been, but the data transfer rate is still very important and probably very impressive in the Jaguar, since the bus used for graphics etc is 64-bit. I don't think the internal register width is a major trade-off, they (Atari) have made the most important part powerful enough.

I believe it's better (with respect to price/performance) to design hardware with more data bits than hardware with higher clock speed.

Well, I remember the time no Amiga users posted here -> nobody posted here.
Probably the only people knowing the Atari still sort of exists are the
Amiga users.

I agree with Kendall, I accept the label 68030 SX, however to say that the Falcon is a 16bit machine is madness. And if you say that the Falcon is crippled by its bus you obviously know *nothing* about compilers or caches. The Falcon probably suffers about 25% performance loss for compiled code and 15% for hand-written stuff, which is less than the difference in Video contention between AGA Amigas and the Falcon.

Food for thought indeed.

Just my last .02 cents Kendall, I have no intention (except via private mail) to continue this.

What are those Intel 286 with a 32-bits graphics coprocessor for sound and graphics that you can buy then? 16+ machines? No way.

What are the Intel 386SX machines with the same graphic/sound cards?

Your logic applies to them too, and I bet that if we were talking about the 32-bitnes of an Atari TT vs those PC clones, you'll probably would have said that the TT was a 'true 32-bit' while that 286 was definitively 16-bit.

Food for thought...

Ok, I will admit he seems a bit emotional. But he got some points
and he has cited that ATARI Jaguar Engineer post. He got his points,
it's not pure garbage, although I don't agree 100% with him either.

I guess that the "XXXX is an idiot" has a huge intellectual gap
from this postings...

How can you consider the Pentium to be a 64-bit chip while saying that the Jaguar's GPU is only 32-bits? I hate to break this to you, but the Pentium is exactly like the Jaguar's GPU. They both have 32-bit internal registers and an external 64-bit data bus!

Finally, considered as a _system_, the Jaguar can transfer and process information 64-bits at a time. It contains a true 64-bit Blitter which can perform logical operations on data 64-bits at a time.

I already acknolweledged that the ST/Falcon has bitplanes.
Thanks to all those who pointed it out.

Don't yell that loud, NEVER *EVER* has this been mentioned
around here when we talked about graphics on those machines,
that I have been reading.

Do you even know what a Blitter is? Not only does it move and shift memory around, but it can also perform logical operations on the data (i.e. XOR, AND, OR). Therefore, the Jaguar can process and transfer data 64-bits at a time!

Wrong! The ST does have bitplanes. You're confused because it uses an interleaved bitplane format. Data for the multiple bitplanes are interleaved with each other as opposed to lying in separate areas of memory. I think I first heard the term "interleaved bitplanes" in a 1987 book from Compute! on programming the ST.

The Falcon also uses an interleaved bitplane format for all its graphics mode except for its 15/16-bit True Color mode (which uses a chunky pixel format -- sometimes called a packed pixel format).

|>
|> Someone in the know cares to comment? (about the Falcon)

Grif is right. The ST, STe, TT, and Falcon all have bitplanes. I admit they are organized in a manner that is best suited to games. Each bitplane is contiguous, that is no other bitplanes exists within its memory address range. And a single 16 bit word of memory contains bits for sixteen different adjacent pixels. I have the documentation, if you want it get an old copy of the Abacus book Atari ST Internals. The Falcon's memory is organized the same way, with the exception of the true-colour mode, which is organized as one word per pixel.

Raist you may be back but in this instance you are still wrong.

Brian

Mike Draeger (draeger@lcc1.nsc.com) wrote:
: William Fang <int877w@lindblat.cc.monash.edu.au> wrote:
: >Perhaps only DEC can rightly call their Alpha a 64bit system. All the
: >general purpose registers and pointers are 64bits wide in the Alpha AXP.
: >NB, I'm not implying that current implementations have 64 bits of real
: >address pins.

: The above lines from you capture most of how a processor is classified.

You chopped off the bit where I said 64bit registers and 64bit ALU.

: However you also suggest that a processor with 48 address bits can
: not be considered a 64 bit processor.

: You don't seem to understand the fundamental items that make a processor
: "XX" bits.

: It certainly is not address bits or lines! That is absurd.

But the data lines are about the end of the 64bitness of the Jag and
Pentium, which every man and his dog is proclaiming to be "full" and
"true" 64bit systems. Of course is absurd, but it's popular wisdom.

: A "32 bit processor" can rightly be called a true 32 bit processor if:
: It has 32 bit DATA registers, performs primarily 32 bit operations,
: and has 32 external DATA lines. (This is open to some interpretation, but
: this is essentially it.) (i.e. GP regs are 32 bit, ALU is 32 bit, etc).

Does etc mean that all this must happen in one clock cycle?

[...]

: The important issue is that you claim that the number of external address
: lines might somehow effect the processor bit size? Ridiculous. If you
: only want to address 4 GB, use 32 external address lines. You are still
: a 64 bit processor. (You implied this. If I am reading too much into
: your statements, ignore this paragraph).

I'm aware of this. There are lots of processors that have address/data
buses smaller or larger than the ALU. Zilog Z80, MC68000, intel386sx,
HP PA, blah, blah. The address lines could be touted as defining
the bitedness of a CPU if the marketing guys made all the definitions
and it was the largest bit size component on the CPU.

: Now, back to the Jag. We know it is 64 bit externally in many
: speed critical areas. I don't know if anyone knows for sure if the
: general purpose registers are 64 bits and if the ALU is 64 bits.

Please read this quote:

|John Mathieson <CIS: 100111,2631> - one of the designers of the
| Jaguar - speaks with authority on Jaguar hardware:
|
| [...]
|
| The RISC processors manipulate 32 bit data as this is all the
| ^^^^^^^^^^^
| precision they need. They have 32 bit ALUs and 32 bit address
| ^^^^^^^^^^
| generators. They can perform 64 bit transfers on the main bus if
| they need to, but not many data are this big. The graphics
| processor uses the blitter as a co-processor when it really needs
| to blast pixels. The instruction size is 16 bits as this allows a
| reasonable number of instructions plus two register/data fields in
| each instruction.

: If the data registers and ALU are 32 bit, it is a 32 bit processor,
: plain and simple. If this is the case, Atari is simply lying. I have
: not seen any real evidence of this, however. I would think that
: DataQuest and other such tech publications/journals would tear Atari
: to shreds if they claimed the TOM and JERRY chips were 64 bit chips,
: but in fact were primarily 32 bit chips. But instead they just say
: that it they are 64 bit processors. Likewise, the game mags have
: not said anything about this (to my knowledge). I can only conclude
: that you are wrong.

Fair enough, if that's your conclusions. The only information I've seen in the game mags is recycled press releases and ad copy. How hard is to do some research?

The 16 bit instruction size is a bit worrying. The TOM and JERRY chips have small caches, which probably are adequate to the task. There has been no mention of the degree of pipelining, TLB or level or microcoding, not that these define bitedness, just point to the power of the architecture.

: Thats it. I will grant you that if the registers are 32 bits wide,
: then Atari is a piece of shit and is lying to confuse the market.
: Otherwise, their claim is valid.

So, from the main Atari Engineer behind the GPU and DSP quote, does it look like the Jaguar has 64bit registers and ALU? So am I moron for doubting that the Jag is a 64bit system and has a 64bit cpu?

I have no problem calling the Jag as 32bit system with 64bit memory access, as a 386sx is a 32bit system with 16bit memory access, or the Atari Falcon is a 32bit system with 16bit memory access. Bus and memory access are easily interchangeable in this context.

[...]

: Oh come on now, it's just marketing hype, something which has been
: proven to sell things. If you guys want to insist on complete truth
: in marketing and advertising, don't you think that all companies and
: their products should be held to the same standard?

Why in the hell shouldn't they use the same terms and contexts as everyone
else? I expect them at worst to be economical with the truth.

Or do you sell PC clone boxes like this:

**** Skip Computers Advertising ****

Multispin CD ROM drive - It's really a single speed, but has
stop and go, hence multi speeds and
multispin.

24bit graphics accelerator - It has more than 24bits of RAM, but
can only display 8bit colour in 640x480.

4MB standard with all systems - It comes with 2 banks filled of
256KB simms and 2MB in the graphics
card.
If you complain that you've double
counted the video, they give you one 4M
simm and tell you to get lost.
Happy?

256KB cache - It's actually the size of the
smart-drive cache, not the 2nd level
like everyone advertises.

: BTW, the comment above about the HP's 48bit address space brings up
: a good point. The CD32 has a 68EC020, right? Doesn't that chip have
: a 24bit address space, not 32bit? Using the logic above, shouldn't
: Commodore be similarly chastised for claiming that the CD32 is a 32bit
: machine? Wouldn't CD24 be more appropriate?

Only if you think I was serious ;-) I'm perplexed why HP don't call
their HP PA 64bit systems, or even 256bit systems, which Intel seem to
be calling their Pentium.

: One thing that I can't figure out is why anyone cares how a company
: markets its products. Is there a reason why consumers need to be

: protected? If they are too stupid to do a bit of research about what
: they are buying it's their fault, not anyone elses. I for one do not
: relish the thought of various agencies trying to protect me from the
: companies with ridiculous rules and regulations.

Why in the hell not? If you advertise something, you should be telling the truth. Do you order clone boxes and happily pay for an inferior product, with less RAM, smaller Hard-drive, smaller monitor, smaller case, than advertised?

Or do you go to Unlicenced Bob's 24hour medical clinic? Or happily pay for quarter of a gallon of gas when you are charged for a full gallon due to the corner gas-stations pumps being faulty. But you should have known that, shouldn't you?

If gaining information was timeless and costless, then it would be fair to make consumers to do research. But it isn't, so it's often easier and more cost effective to make laws. 10 million consumers spending $10 each researching a product is more expensive than the producers of a product to send $10 advertising the truth.

Well you might have a different definition of a processor to the rest of the computer science world, but I'm afraid that a blitter is nothing more than a co-processor at best. Processors are generally Turing-complete, and a blitter certainly is not. The act of sending a signal along a data bus is working on, hence processing that data, but that does not make the data bus a CPU now, does it? Face it. an n bit system has an n bit (or greater) data bus and an n bit processor. Under this logic, the Jaguar probably ranks as nothing more than a 16/32 bit system, and the falcon is probably more 16 bit than anything else. The A1200 and CD-32 are both true 32 bit machines. Sorry, the truth sometimes hurts.

Well, not quite a moron... B-) But the Jaguar does not really have a CPU, as such. At present, games use the 68000 as the CPU, but future games could use the RISC chips entirely.

>I have no problem calling the Jag as 32bit system with 64bit memory
>access, as a 386sx is a 32bit system with 16bit memory access, or the
>Atari Falcon is a 32bit system with 16bit memory access. Bus and
>memory access are easily interchangeable in this context.

The object processor and blitter can read in 64 bits of data into two registers with one instruction, and can manipulate 64 bits of data internally with single instructions.

I wouldn't be so sure that a Blitter is not Turing-complete, since the Turing model of computation is a very simple one, (only 3 or 4 operations). I've never heard the definition of a processor related too Turing-completeness, and anyway the Turing model of computation is only one of looking at things, what I think you really mean't is that Processors generally fit in with Church's Thesis.

>

I never said that the Jaguar has a true 64-bit processor. I've said
all along that I consider the Jaguar's GPU (contained in the custom
TOM chip) to be a hybrid 32/64-bit processor.

What I am claiming is that I consider the Jaguar to be a true 64-bit
system because it can transfer and process information 64-bits at a
time. How does it do this? Because it has a true 64-bit data bus and
it has true 64-bit components (64-bit Blitter and 64-bit Object
Processor) that can process information 64-bits at a time.

> that the processor can address linearlly.

Perhaps this is the simplest way to think about it: Something is a
32-bit processor if it can PROCESS 32 bits of data. Period. How much
it can address or load the bus with is irrelevant.

> Now, back to the Jag. We know it is 64 bit externally in many
> speed critical areas. I don't know if anyone knows for sure if the
> general purpose registers are 64 bits and if the ALU is 64 bits.

I'm sorry, but I must disagree. Jez San (?) has had access to the
Jaguar's specs and internals, and he has said that Tom and Jerry, without
a doubt, have 32-bit registers. I have seen nobody try to refute that
claim, and on CompuServe it has been made in places just swarming with
Atari personnel.

The claim that Atari people make is one of these: 1) Tom and Jerry can
load the bus with 64 bits of data, so they are 64-bit processors, OR
2) OK, Tom and Jerry are 32-bit processors, but all the Jag's processors
work with a 64-bit bus, so even though the Jag has no true 64-bit
processors, as a whole it is a 64-bit system.

> Thats it. I will grant you that if the registers are 32 bits wide,
> then Atari is a piece of shit and is lying to confuse the market.

I think that's a little strong. Atari seems to be making claim #1
above. Some of their more conservative fans make claim #2 (including
Jez San). Others, like me, consider the Jaguar a 32-bit system.
There is a lot of gray area here, so while Atari's claim may be a
little shaky, they have enough basis to make it, and it looks good.

Well, the processor in the jaguar tom chip can load two adjacent 32-bit
registers with one instruction. There is a 64-bit read for you.
The same processor then can also do barrel shifting, so it can bitwise
shift more than one 32 bit register at a time. So it can then process
64-bits (or more) of data at a time.

So by your own definition, the jaguar has a processor which is at least a
64-bit processor. Period.

Can we end this silly debate?

> Falcon.

But the Falcon _IS_ crippled by its bus. This is the way I see it:

The Falcon is a 32/16-bit system.
The Jaguar is a 32/64-bit system. (even 16 if counting the 68000)

Now the marketing dept at Atari will of course pick the numbers that will show up best for each system, just like any other company in their right mind would. Do you think if Commodore or Sega had released the Jaguar, that they would have labeled it a 32-bit system? Not bloody likely! All this tech hype aside, I don't doubt for a second the superiority of the Jaguar over the CD32, or for that matter, that my Falcon is more powerful than the A1200. This however, doesn't automatically guarantee success for either system. There are too many factors to consider here, such as:

Past company reputation.
Current userbase.
Name recognition.
Marketing skill.
Software base.
Availibility.
Price.
etc.

Unfortunately Atari didn't do so well in some areas in the past, though it looks like things might have changed with the Jaguar.

Anyway, I enjoyed reading your flame-fests. They make good entertainment on a dark night! :-)

No you would be wrong to call it a hybrid chunky-word system - the defination of
chunky pixels as I see it is that of a whole pixel being represented by
a group of contiguous bits, this is *clearly* not the case with the ST.
80% of Amiga games interleave the bitplanes on each line, or didn't you know
that? Talk about shooting yourself in the foot.
How can U possibly comment if you have never had any experience with the ST,
I have experience with both ST and Amiga and know the pros' and cons' of each.

You are also completely wrong about it giving all the disadvantages of a planar
architecture, for example the screen format allows area/polygon filling to
be done 20% more quickly than on an Amiga, this is one reason why 3d games
tend to run faster on the Atari range of machines.

Many bugs have gone with TOS 2.06, but there are still enough left.

>I'm curious:
> (i) What are Atari's plans?
Ask Atari...

> (ii) Does Tramiel still own the company?
Yup.

> (iii) What is the difference between the falcon and jaguar?
The Falcon is a computer, the Jaguar is a video game system. They are entirely different, the only similarity is that both have an 680x0 inside (Falcon: 68030@16 MHz, Jaguar: 68000@13.3 MHz). The custom chips of the Jaguar are much more powerful than those of the Falcon. The Falcon has a freely programmable graphics chip with 1,2,4,8 bitplanes and a 15/16 bit chunky mode. It has a 16bit sound subsystem and a built-in Digital Signal Processor (Motorola DSP56001) that is currently used for sound effects (e.g. a MOD-player with low CPU load), JPEG-decoding, etc. .
The Jaguar has two special custom chips, 'Tom' and 'Jerry', a 64 bit bus, 24 bit graphics, 16 bit sound.

> (iv) How good is the software support for the Jaguar(another
>awesome machine with no software?)
There are games there, read rec.games.video.atari for details.

The 1200/CD32 is a 32/16/8 by that logic.(blitter is 16bit, Paula is 8 bit...)
By the same definition Pentium based stuff is 32/64 bit as are most other
'64bit' processors. IMHO the Falcon is more 32bit than 16bit (48bit in some
areas, since the DSP has 48bit/56bit internal registers), the same goes for
the Jag -> it has enough 64bitiness to justify the label.

That's going to really help ST and Falcon sales. Let's face it, they are both dead end systems, with a tiny user base and low amounts of software available.

Has Atari made any noises to what their plans are for the future? Any hope of a new ST or Falcon model to run all the TOS/Mint software you've bought? Or are you going to assigned to computer obscurity, like the Commodore Plus 4, Spectrum, Oric and other orphaned machines? Your computer and software is going to be cupboard-ware.

>* "Tom" consists of THREE processors: A 64-bit blitter, a 64-bit object
>processor, and a 32-bit graphics processing unit. "Tom" is 64 bits.

Not really. Tom is a mixture of 64 and 32 bit processors. It has a 64 bit
bus interface. You can't call it a 64 bit or a 32 bit chip...

>* "Jerry" is a 32-bit Digital Signal Processor. "Jerry" is 32 bits.

With a 16 bit bus interface.

>* The GPU in "Tom" can access 64 bits of data at once with a "load two
>registers" instruction, but it is not part of the normal processing.

Mmm, sort of. A previous poster said that it can load two adjacent
registers with one instruction. This is incorrect. The top 32 bits go into
a special register which appears as a memory-mapped I/O port. To do anything
with it you have to read it into a GPU register, which takes an extra
instruction. This is not really much faster than reading two dwords,
but it uses less bus time.

>* Of the five processors in the Jaguar, one is 16-bit (the 68000), two are
>32-bit (the GPU and the DSP), and two are 64-bit (the blitter and the object
>processor).

Yes.

>* The Jaguar also uses a 64-bit memory architecture, according to J. San.

64 bits wide, with a 64 bit bus, yes.

On Feb, 12 I will host another Midi Maze party. If you didn't make it to last months meeting, then you really missed out. Mucho thanks to Tim Wilson for bringing the machines/people that he did. There were six ataris and 2 IBM's at the party and we had a blast. Now for the important stuff on what to bring:

1 Atari (whatever) as long as it has Midi ports
1 (or more) Midi cables
1 outlet strip (important)
beverages (if you bring alcohol, it is not my fault if your reflexes suffer)

If you have an IBM, and want to bring it then please do so. We will be playing doom, hopefully on a ethernet this time.

Please email me to RSVP and to get directions.

--
If you love something, set it free.
If it doesn't come back,
hunt it down and kill it.

> (i) What are Atari's plans?

You kiddin? World domination of course! :-)

> (ii) Does Tramiel still own the company?

Enough to control it.

> (iii) What is the difference between the falcon and jaguar?

Falcon is the newest computer. Basically, it's a souped up STE with the
addition of DSP, 16bit 8ch sound, better graphics (ie VGA+) and SCSI 2. Jaguar
on the other hand is a comletely new, 64bit (well, sort of anyway, better not
comment any more on this topic) game console with some awesome specs. It seems
to have become the new pet of the games industry and Atari is actually
marketing it. (gasp!)

> (iv) How good is the software support for the Jaguar(another
> awesome machine with no software?)

So so... Falcon is strong on music and graphics, less so (but still ok) on
general apps. Jaguar is likely to set new standards in home video gaming.

>The same processor then can also do barrel shifting, so it can bitwise
>shift more than one 32 bit register at a time. So it can then process
>64-bits (or more) of data at a time.

Unfortunately you're wrong. A barrel shifter is not some magical thing that can
shift several numbers at a time. The b-s is used to shift _one_ number more
than one step in one clock cycle.
You find barrel shifters in most modern processors, for example the M68030.

A barrel shifter can be made from a series of multiplexers, where the first
selects between unshifted and shifted 16 steps, the second between unshifted
and shifted 8 steps and so on. As you can see this will enable you to shift
a 32 bit number any number of steps in the time it takes to go through five
consecutive multiplexers.

>So by your own definition, the jaguar has a processor which is at least a
>64-bit processor. Period.

No! See above.

>Can we end this silly debate?

Good idea!

>
>Please quote. Or are you making it up?

I remember the message Rickard is talking about, but I didn't save it.
Perhaps someone has saved the original messages, but I'm about 98% sure this is what happened:

(The messages in rec.games.video.misc were not from Jez San himself, but were quoted from some other place. It might have been GENIE.)

In the first message Mr San stated that the RISC processors in the Jaguar were _not_ 64 bit.
In the second message he stated that he considered the Jaguar to be a 64 bit system because many of its other parts that _are_ 64 bit.

Someone complained of course and said that the two messages were contradictory, but I think it was generally agreed that they were not.

By the way, I've also designed a processor or two from scratch (at the U.), so I guess my opinions must be interesting as well: ;-)

- I agree completely with Jez San.
- It would have been stupid to put a 64 bit RISC in the Jaguar. The only point I can see in using 64 bit registers (for integers) is for memory mapped file systems and that certainly won't be necessary on a game machine.
- If the Jaguar RISC pipeline really lacks forwarding (someone claimed that), I think it'll be hard to program. (I always include forwarding :-)
- I consider the Falcon to be a "68030SX" as someone suggested, and I intend to get an accelerator board for it as soon as I have the money to spare. (The machine is faster than I would have thought, but I don't believe in the dual speed bus that has been mentioned.)
- I'm going to buy a Jaguar. (Not an opinion perhaps, but... ;-)

We have been over and over this before...parts of the Jag's system
architecture are 16-bit. Like the "real" cpu (68000) - don't let
people hype you otherwise only has 16-bit access to memory.
But I don't want to get into all the reasons why I believe a Jag
is not 64 but, but really 8-bit (just joking), its 16. Anyhow, this
was a message to Atari ST/Falcon users to allow them to buy a
superior platform.

PS - This is a really good flame here...take it with a grain of salt
and don't be so serious in life!

Ah, so the Falcon *is* 16 bit then? (compare with 80386SX, Intel do not, I believe claim this to be a 32 bit CPU.)

pedantic pedantic pedantic...

ok then.. yes the Falcon has a 16 bit CPU...
but its still reassuring that this 16bit CPU delievers more mips than a 14mhz
68020...

The 32bit video system has more bandwidth than the 1200, has both chunky and
bit-plane modes and is far more flexible on 'real' monitors like multisync
/SVGA.

The sound system makes the Amiga look like the games machine that it is.
If you've ever heard a MOD file played in 16bit stereo with linearly
interpolated 50khz DSP sound (like my Falcon tracker player) then U would
realise this.

The DSP can do most graphical operations as fast as an 040 amiga (believe it),
and can do number crunching based on multiplication and addition twice as
fast an 040.

As for lack of s/ware for the Falcon? yes there is not so much commercial
s/ware, but the quality and amount of PD and Shareware is amazing, i have
about 150 mb of Falcon specific stuff.

>that you are wrong.

The thing is, that Atari really claims the system as a whole is
64-bits. Also, while the ALU in the RISC chip in TOM is only 32-bits,
the data path is 64-bits - and the other two chips in TOM are true
64-bit entities. So I think it is wrong to say they are lying...

That's nice - but note that the quoted lines do not preclude the use
of TOM primarily, but say that it will be somewhat slower if it has to
go outside the memory it has. How much slower, we don't know - do we?

I never commented on your ability to spell - that would be a poor
idea, considering the state of my own spelling. BTW - Luser is a
derogitory term, of the type oft used by the more obnoxious people on
the net. I included it to convey "sarcasm".

I have long forgeotted the original post I was responding to - but it
did have fairly bad grammar. Much much worse than forgetting an
"And", which would have looked odd had I included it anyway.

You can get overly picky about grammar, you know.

So, to summarize, I'll list the new faults I've found with your post:

* Lack of understanding of ceratain terms

* Too picky in the grammar department

Feel free to post again, and I'll be more than happy to point out
other flaws you may have!

It sound slightly less crap than the 8bit stereo mod. Let's face it,
you can do only so much with the original sample. Interpolation
doesn't automagically make it a clean 16bit sample. The Atari falcon
is a lame machine, with a user base hovering around 2% the size of the
million AGA amigas sold, and 0.33% of the say, 6 million colour Macs
sold.

[...]

: As for lack of s/ware for the Falcon? yes there is not so much commercial
: s/ware, but the quality and amount of PD and Shareware is amazing, i have
: about 150 mb of Falcon specific stuff.

Big deal, I've got 500mb of Linux XFree software and several gigabytes
of Pc stuff on CD's. There are about 2 gigabytes of Amiga software
floating around, with about 1 gigabyte of that stuff in Aminet and
600MB of Fred Fish PD software.

There's only so much software that can be generated by 20,000 or so
users.

Actually, Jez San said that the GPU (contained in TOM) has 32-bit registers. TOM obviously contains 64-bit registers since it contains a 64-bit Blitter and Object Processor in addition to the GPU.

Yeah yeah, to tell the truth, I'd rather have AGA's rather impressive graphics
capiblitites than the Falcons slightly imporved sound. Triple-A will, of course
have the best of both worlds with 8 channel 16 bit 100KHz sound.

Perhaps someone should provide a more efficient C compiler for the Falcon then.

What 'real' world is this?

A 68030 can multiply and divide / perform Floating point arithmetic loads faster
than an '020. So for raw computation the Falcon is superior -> we won't count
the DSP of course which can do floating point as fast as a 68882 or about 8
times faster than an a1200 (with fastram).

As for compiled stuff, the Data cache means that stack based variables
are accessed faster than on an '20.... the parallel execution of the '030
also means that it is faster for many instruction sequences.

I think you live in a world of your own ;-).

Why is AGA more impressive than the Falcons Video chip? The Falcon has more
video bandwidth, True colour (no 8 bit kludge's here...) etc.

What is better about AGA? its lower bandwidth, lower refresh rates? or
that wonderful(laugh) HAM mode, no perhaps its the video contention being
twice as much as the Falcon that makes it better ;-).

Funny that, I don't see 'Pure C' for the Amiga.... and we have the best Amiga compiler (SAS) on the Falcon too. And believe me Pure C 2.0 (Borland) walks all over SAS in every way.... ooopppsss sorry that can't be right, after all the Falcon has no s/ware support ;-).

Sorry, a 68030 has no hardware FP support. At least no more than an
020. The 030 is faster on MMU accesses (because it's builtin) and memory
accesses (slightly because of its caches).

>the DSP of course which can do floating point as fast as a 68882 or about 8
>times faster than an a1200 (with fastram).

Again, wrong. The 56001 does no FP at all. It can do fixed-point
arithmetic and integer arithmetic only, and at lower precision. In
addition, the 56001 has problems of its own: a slow, narrow host port
and limited memory access. How are you measuring your "8 times faster"?

>are accessed faster than on an '20.... the parallel execution of the '030
>also means that it is faster for many instruction sequences.

There's no parallel execution in an 030 --- the closest you get is
parallel translation by the PMMU, and the slightly pipelined cache reads and
instruction decodings.

>compiler (SAS) on the Falcon too. And believe me Pure C 2.0 (Borland) walks

I know a 68030 does not have Floating point support, however an 030 can
implement s/ware floating point routines faster than an 020 due to improved
microcode which leads to faster integer multiplication and some parallel
execution of instructions. If you've ever written FP routines then you
will realise that you get 100% cache hits, because most stuff like FP
multiplication/division etc are iterated loops.

>>the DSP of course which can do floating point as fast as a 68882 or about 8

Wrong.. the 56001 can perform FP arithmetic in s/ware 5-8 times faster than
a bog standard 030.
It can do an integer multiplication 16 times faster than an 030!
it also has instructions for normalisation of numbers which are used
extensively in FP calculation, therefore it can implement high speed FP.

>>compiler (SAS) on the Falcon too. And believe me Pure C 2.0 (Borland) walks

In my experience Pure C is the best 680x0 compiler I've ever seen. What form
would you like this comparison to take? I recently ported MPEG to the Falcon,
so if you like i can post the code produced by each compiler for the IDCT
rout... believe me... PUREC kicked ass!

>
> /
>/ Daniel

Yes I agree Daniel, even with its 'SX' label I still think the Falcon '030
can outperform the EC020 in the 1200.

some facts:
The Falcon can move about 3meg / s in monochrome, or about 2.6 meg/s in 16 bit
colour mode. How much can a 1200 move in 640*400 *256 ? (laugh) -> the timings
I did indicate that there is about 70% contention in this mode on the 1200,
and about 40% contention in 320*200 * 256.... which is really quite poor..
i'd hate to see the figures with the blitter and copper going... *bye bye CPU!*

warwick@cs.uq.oz.au (Warwick Allison) writes.....

>>u9283919@athmail1.causeway.qub.ac.uk (John Gerard Kelly) writes:
>>Gavan (via 3rd party account)

>Gavan! You're STILL crapping on about how much you hate the Jag.

Exactly where did I say that I hated the Jaguar? I simply pointed out that many of the claims made by the dumb advocates in this group were bogus. AND I produced a statement from the Chief engineer who designed the Jaguar which supported my claims - a lot of you fanatics don`t seem to be too worried about producing evidence to back your ravings.

What I dont have a lot of respect for is Atari the Company. The Jaguar is a good product, but I can see Atari blowing it like they did with all their past products. Theyve already made some real botches - like not having it out in force for XMas and having such a tiny range of games ready for it. The thing was officially released on oct. 31st, yet there are only around 4 or 5 games out for it at the moment. Whats more, Atari have been unable to manufacture the thing in large enough numbers - result is comparitively few sold. Its all very well selling `all that you make` but better to make 250000 and sell 200000 of those over Xmas than make 60000 and sell them all.

>Poor amiga owners... at least Atari owners have a chance of not being
>out in the cold FOREVER (ie. Atari has a Product [be it a game console],
>Commodore doesn't)

Poor Falcon owners, at least Commodores current product (the CD32) has a large measure of compatibility with their computer line. People who bought Atari COMPUTERS are really shafted now - no support from Atari (there never really was anyway) and the only future product looking like being a games console. Atari owners seem to assume that if the Jaguar is successful, then success with the other lines will follow. I very much doubt this. Maybe the Lynx would benefit from Ataris increased profile in the games industry, but I doubt that Jaguar success would do much to rejuvinate the failed Falcon.

Perhaps Ataris best hope of making a successful COMPUTER system (something they never really have done, in the commercial sense) is to hope that the Jaguar sells well, and then to make a computer based around the Jaguar chipset, with a nice powerful 030 or 040 as the CPU. This is a computer I WOULD be interested in, since although the Jaguar is a good console I am not really into consoles and paying 50 quid a time for cartridges on a system that I cant program.

Its amazing the Amount of Atari advocates who slagged off the Amiga for its games prowess, who now shout about the Jaguar. A year ago most of them professed not to play games. Seems like Atari-heads have to have something to shout about, and no one wants to talk about the Falcon anymore.

>And poor "John Gerard Kelly"... what a unfortunate way to get >yourself >in someone's kill file. (and poor Gavan for already BEING in so >many >kill files that he has to post via other account to get heard!)

Yes, its really sensible to read an advocacy group and then refuse to listen to any opinions which diverge from your own, isn`t it?

I`ve noticed that a readiness to engage in debate in mysteriously lacking in this group. When confronted with unfavourable facts, most people here either lie or throw insults. Personally, I`d rather be in that kind of persons `kill file` than have to put up with their childish rants.

Heres a suggestion to those who dont like other peoples views -

DONT GO ON USENET DISCUSSION GROUPS OR YOU WILL GET UPSET.
(especially the advocacy groups)

Michael,
Well I see you had some problems, myself I have had good service from them, I had a monitor they shipped to me but it was cosmetically broken so I arranged for them to ship me another one and I would keep the broken one (it was still usable) until the other one arrived, well it had problems too so I sent it back and they then shipped me a CTX 14" proscan it was GREAT, so I shipped the broken one back and they did say they'd put the cost of shipping to my account and they held good to that.

I ordered a 8meg ST ram from them, it went bad, I kept it until they shipped me another one and then I shipped it back to them and they credited my account, it is working GREAT.

I also have ordered several software packages from them and no problems.

Just thought I'd add my 2 cents worth.

Nice dodge, except that 1. the 020 also has instruction cache
and 2. FP is not data intensive. The only reason 030's are faster is
because they're available at higher clock speeds than 020's.

>It can do an integer multiplication 16 times faster than an 030!

Okay, you're right here, somewhat. It's slightly less than 16
at comparable clock speeds.

>it also has instructions for normalisation of numbers which are used
>extensively in FP calculation, therefore it can implement high speed FP.

Useless since the normalization is good only for fixed-point
math (FP normalization is different) at a limited resolution (<24 bits).

>In my experience Pure C is the best 680x0 compiler I've ever seen. What form
>would you like this comparison to take? I recently ported MPEG to the Falcon,
>so if you like i can post the code produced by each compiler for the IDCT
>rout... believe me... PUREC kicked ass!

I don't believe you. I don't believe that you have seen the best
68k compilers yet if you're restricted to PC-level compilers. How about
we post some code and see how the compiler performs. Here's mine:

```
/* Assume DrawSpan is not inlineable but could take parameters not on
the stack. */
struct Edge
{
int x;
int sx, e, dx2, dy2;
int cover;
struct Edge *next;
}

int kold, k, leftx;
struct Edge *e, *EdgeActive;

for( e = EdgeActive; e; e = e->next )
{
while( e->e < 0 )
{
```

```
e->x += e->sx;
e->e += e->dy2;
}
e->e -= e->dx2;
}

k = kold = 0;
for( e = EdgeActive; e; e = e->next )
{
k += e->cover;
if( kold == 0 )
leftx = e->x;

if( k == 0 )
DrawSpan( leftx, e->x, i );
kold = k;
}
```

I'll pass whatever code you want through the compilers I have access to (SAS, GNU, and a commercial compiler from elsewhere), and we'll compare. It would be nice if you could extract a piece of code similar in length to mine.

Yes yes, the whole world knows that the 68030 is a tweaked 68020. However, the abysmal bus architecture in the Falcon will cripple it a lot more than you imagine. Take the A4000-040 as an example. An A3000 with a 25MHz 68040 is noticibly faster, with the same CPU, because it's memory architecture is better, and they both have 32 bit busses.

|>
|> As for compiled stuff, the Data cache means that stack based variables

How fast is the video RAM in the Falcon? If it's faster than 80ns, then yes, it does have more video bandwidth. If is isn't, then it doesn't I'm afraid (By increasing the scan rate on some of my video modes on the A1200, the bit planes eventually start to seperate, which I think is probably due to wait states, which would imply that the RAM is the limiting factor, not the fact that the bus is 1.6MHz slower.)

True colour? with only 65536 of them? Excuse me whilst I snigger a bit. Right, thats better. Good graphics are in the eye of the beholder, and believe me, 1400*590 HAM8 looks a lot better than anything the Falcon will be able to produce.

(We can even update them faster, cos the A1200's CPU gets 32 bit access to its RAM, all of its RAM)

|>
|> What is better about AGA? its lower bandwidth, lower refresh rates? or

Perhaps if you had an up to date version of SAS.. It seems that the nice people at SAS don't regard the Atari machines as being as important as Amigas. BTW, let me know when you get a word processor that's a quater as good as Wordworth III will you?

DSP multiply takes 2 cycles, an 030 takes 17-31 cycles approx so yes
it is less than 16 times faster on average, but the dsp can also do this
instruction in 2 cycles:

mac -y0,x0,a (which means a = a + (-y0*x0))

which would take about another 4-6 cycles on an 030.... then again the DSP
can also to this instruction in 2 cycles:

mac -y0,x0,a x:(r0)+,y0 y:(r4)+,x0 (which means a = a + (-y0*x0), then
fetch y0 from the address [r0], increment
r0, and then fetch x0 from [r4], increment
r4 (PS r0 and r4 can be pointers in
circular buffers which are defined by M0
m4 ....)

basically an 030 is blown away by a DSP... certainly more than 16 times for
most multiply/accumulate type sequences. People just don't realise how good
these chips are at what they are designed to do!

>>it also has instructions for normalisation of numbers which are used
>>extensively in FP calculation, therefore it can implement high speed FP.
> Useless since the normalization is good only for fixed-point

>

The set of FP routines supplied by motorola (from the Dr bub BBS) use
the 'norm' instruction extensively in their implementation of FP...
I think in this implementation a 'float' multiplication takes about 51

cycles... which means a 32mhz DSP 560001 would be equivalent to a 20mhz 68882.
which is quite a bonus really.(and these routines are not necessarily optimum.)

>>In my experience Pure C is the best 680x0 compiler I've ever seen. What form

How would you like to list the results : as a 68000 listing which we can then
compare subjectively? IMHO Pure C seems to produce 'better' code than
the other compilers I've used (Gcc/Lattice).I think there are plenty of people
who will back me up on this. Why would I lie about which compiler is better?
after all I write in assembly most of the time!

How do you know how much the Falcon is crippled, you never use one, I use
both the Amiga and Falcon daily. The only part of the Falcon which is a
compromise is the cpu BUS ,everything else has 32bit access... If it is
so badly designed how come the Amiga line suffers from 3 times as much
contention ?

70/80ns I think with 32meg /s bandwidth -> the 1200 has 26meg/s.

You base your entire argument on HAM8 mode?!!!
So you are saying that you can update a HAM8 screen faster than a TRUE colour
one!!!!!!!!!!
oh my god, can I have some of the drug that you are on?!
Lets see you do texture mapping/gouraud/phong at 25/50FPS in HAM8... i can
show some of my Falcon demos which do this.

Yes the 1200 has a 24 bit palette, ask some amiga programmers what they would
prefer HAM8 or 65536 colours from 65536 with one word per pixel.

What is better about AGA? its lower bandwidth, lower refresh rates? or
that wonderful(laugh) HAM mode, no perhaps its the video contention being
twice as much as the Falcon that makes it better ;-).
What refresh rate do you get at 800*608?

I get 104hz interlaced from my Falcon. I think the 1200 does 72hz (laugh).

>Perhaps if you had an up to date version of SAS.. It seems that the nice people

Yes its called Word II for Windows, I've used Wordworth III before and it is
really slow and lacking in features compared to other real word processors.
Atari Works compares well with Wordworth III... does WWIII have bitsteam
font support...

Lattice 5.6 is just out actually. I think the people at Hisoft would agree
with me that the Falcon is a nicer machine than the A1200. But then again
you pays your money and gets your computer.

Now kiddies, this is what we call a 'double standard' Do you consider the A500 to be a 32 bit machine? I certainly don't. No, I don't consider the Pentium to be a 64 bit CPU, it's a 32 bit CPU stuck on a 64 bit bus. The A1200 is a 32 bit machine, because it has a 32 bit CPU and a 32 bit data bus, the Falcon is a 16/32 bit machine because it has a 32 bit CPU and a 16 bit data bus. The Jaguar is a 16/32/64 bit machine because it has a 16 bit CPU, 32 bit co-processors, and a 64 bit data bus. The Falcon is not a true 32 bit machine, and the Jaguar is not a true 64 bit machine. I'd like to know wether you consider a 386 SX to be a 32 bit machine? I certainly don't.

Why thankyou, it's the nicest thing anyone has ever said to me.

|> just accept that the CD32 is old technology with a CD attached?

Yes, it is. Just like the Jaguaar is old technology without a CD attached (anyone care to argue about a 68000 not being old technology?)

>discussion. Once again, thanks!

Cheers! It's a bit difficult really, I don't read news as much as I used
to. We are also bound by non-disclosure agreements which basically mean that
I can't say anything that isn't public knowledge. I reckon I haven't stretched
this too far...

Can I ask you guys/gals some questions in return for clearing up the little
arguments?

- What do you guys/gals think of our game (CyberMorph)?
- good points
- bad points
- features you would have liked to see
- anything
- What would you like to see your Jaguar do ?
(BattleMorph, a texture-mapped sequel to Cybermorph, is under development
and I'm currently working on the graphics engine for a Jaguar port of
Blue Lightning, one of the Lynx's best sellers)

I can't think of anything else at the moment, but if you have any points
I'd be grateful if you would mail me (modem@atdetail.demon.co.uk).

BTW I did the level 'GANTLET' for CyberMorph. What do you reckon?

No.. The Falcon is not 100% 32bit, but then again I never said that.
The 386SX is a 32bit processor with a 16bit data bus. Come on there is
much more to judging whether a processor is a certain no. of bits... there
are lots of factors involved. In the same way that you can say that the 1200
is a true 32bit machine I can argue that there are parts which are clearly
not 32bit , the sound , the copper etc. But enough of it is 32bit , the same
goes for the Falcon. (PS werent you the guy that argued that AGA did two
32bit memory fetches in one cycle (loud laugh)?)

>Decent mode? On a TV set? hardly.

Yes, if you put the a1200 into 348*256 dual playfield mode then the 68020
would be almost as slow as the 68000 in the Jaguar. Your fighting a losing
battle here mate,the Jag has another ++50mips on top of this -> the 020
is *all* the CD32 has in terms in processing power. Do you really want
me to start comparing the Amiga Blitter to the Jag gfx hardware? Ill
spare you that embarassment.

>|> (The 68020 is only about 1.8 times as fast w/o fastram to start with! And

Well its true, read above.

>|> just accept that the CD32 is old technology with a CD attached?
>
>Yes, it is. Just like the Jaguaar is old technology without a CD attached (anyone
>care to argue about a 68000 not being old technology?)

A 68000 running at 13mhz gives about 1- 1.5 mips, this is just for game logic, which is normally trivial (most consoles use 0.4 mip processors for this...). Why do we need anything more powerful? there is 50mips of 90s VLSI in the Jag giving more power than 5 CD32s put together. The Jag has 8 times more bandwidth, better sound, 32bit graphics (CD32 only has 8bit colour,HAM8 is useless for games)... blah blah blah... I could go on all day, but most sane people realise that these two consoles are in different leagues.

I just want you to answer one question :

do you really think a CD32 could do a polygon based game as fast as a Jag?

(Im waiting for your answer, hint the Jag can translate 5,000 vertices per VBL, a CD32 about 400).

I had some respect for you up until now,
however please dont push this any furthur, the Jag wins on every technical detail.

Great scott!!!!! I think he's got it !!!!!
Yes, most GAME MACHINES are just toys (expensive one but nevertheless toys).
It cannot be compared realistically to a computer (which is what the CD32
actually is). The CD32 sounds very nice (MUCH!! better then SNES&SEGA) but
NOT!!! better than the JAG.

A4000/40 at LEAST, sure it _can_ do nice things on a smaller cpu but
Babylon5 is not one of them its lightwave all the way (thats rendering
thats cpu all the way).

>The answer is obviously the Amiga 2000/Video Toaster combination! But
>the Amiga 2000 only uses a weak 68000 while the Amiga 4000 uses a
>powerful 68040!

You got to be kidding ill bet 90% of those 2000+toasters2000 are 68040
running 25mhz or more .. The newer systems toaster4000 are ALL 68040
based at least, there _seem_ to be '60 beta's running at this moment
and it thats not good enough for you you add a few screamers (600 mips
units, 4 mips 4400 risc cpu's per screamer). I think both Sea Quest
and babylon5 use the 4000 version plus some screamers ... (he here
in europe commodore even shows a few TV spots round the Sea Quest serie
(like Commodore Amiga Presents ... bla bla)...

>Do you see my point?! In many situations, it's not the main CPU that
>determines the performance of a machine in a specific situation.
>Rather it's the support chips and the overall system design.

You are right ofcource but wrong example take a look at scala300 _there_
you see what a good design can do on a 68000 or 68020.

>Even though the Jaguar uses a relatively weak 68000 as its main CPU,
>it's support chips (graphics and sound) and overall system design
>(64-bit architecture) make it a superior platform as a game machine.

Thats true but lets be fair MANY people screamed 'its not used its only
for game control etc etc' I see only _one_ design/price cut in the jag
no mass storage the Jag specs scream for cool big graphics and 16 bits
sound ...

Eric Smith is still with Atari... More Amiga-type propaganda.

MTOS is written in something called "C", you may have heard of it... it allows you to re-compile on other platyforms! Amazing... I would have though Amiga platforms had C by now. The things you learn in .advocacy... :-)

Wrong!

I have the routine on my hard-drive that I wrote for a demo, I can post the
central loop if you want (18 cycles per pixel if I remember correctly)
Yeah sure it only has one light source... but I could add multiple lightsources
and still it would be 'real-time'.

'352*256' in 65536 colours though. I guess the 'work station' would be 2000*1000
in 24 bit -> hence the need for the power.

And you forgot the blitter (which is a processor by your definition)
and the object processor (ditto) are both 64-bit... So by your own
definition, you admit the Jaguar to have 64-bit processing entities.
Thanks for the support!

And to further clarify your misinformation, the engineer you quote DID
NOT say that the 68000 was the GPU. What he did say, was that the TOM
RISC chip would be slow outside it's 8k block of memory. We certainly
do not know how slow, and you cannot use this to claim the 68000 is
the only CPU. Do not forget that a developer has already sauid that
only 60% of his game was 68000, the rest was TOM RISC, and that figure
has probably climbed by now. When 50% of code runs on each processor,
how can you claim either one is the sole CPU?

>
> If you want to look for name calling then look at your fellow
>Atari advocates who bawl like babies when someone disagrees with

Ofcource DSP's have there good points (and you found them ;-)) but
it just is something different than a normal cpu, if this was not the
case the falcon would have gotten 2 56001 chips not a '30+dsp. Don't get
me wrong i like DSP's (infact we are creating on a 600+ DSP system (only
4 at this time but what the hell) based on the TMS320C40 which can do
two 40 bits float mulu/adds a cycle while a dma is running 40mb/sec
from one/more of the 6 ports)).

----- ------

You don't seem to sure yourself ;-)

>who will back me up on this. Why would I lie about which compiler is better?
>after all I write in assembly most of the time!

It depend what you are doing some programs need to be readable to others,
we use assembler on the dsp's because we need the control/speed and the
programs (because of the speed needed) are very small (around 20-30
c lines).

The Jaguar is quite good, and could do MKII - just look at Cresent
Galaxy for an example ofgreat graphics and smoothness.

Right now, what it does lack to a certain extent is games - but more
are coming out. I'd say my mid-year, you could look at the Jaguar and
see a number of games that you'd consider quite good (like Doom).

A number of the current games are pretty good too, though - Raiden is
great, and is a lot of fun two-player. Cybermorph is also a lot of
fun, though you have to like that kind of game.

The phrase pops up twice... and although the data manipulated may be
32-bit quatities, what matters much more is the size of the bus - that
is where things will get held up.

Weither or not you personally buy that the systenm as a whole can be considered 64-bit, are you really saying that the public will not buy the 64-bit claim? You have a lot more faith than I do! Just look at the media - they have swollowed the 64-bit thing hook, line, and sinker. The general populace is rather a lot more likley to be influenced by this claim, not having any education to tell them otherwise.

>mind so much if it weren't for the double standards, ie:

It is more than just the BUS - the memory access is 64-bits, the
blitter and object processor (more advanced than anything in the
Amiga) are true 64-bit hips, and the TOM RISC chip can load/store
64-bits of data at a time.

>
>If the Jaguar is 64 bit, then the Falcon is 16 bit.

>

The Jaguar is a 64-bit system - that is pretty obvious. The Falcon
issue is another matter, and I won't continue that discussion out of
boredom - you know where I stand, and I know where you stand.

But the 64-bit bus is hooked to all of the chips that do graphics
handling - the most expensive task in a game system. This is TOTALLY
different than the Falcon - you are comparing Apples to Aardvarks!!!
And a lot more to the system is 64-bit than just the bus.

What lies? The Jaguar has a good, solid claim to be called a 64-bit
system. Even the very developer that you so love (Jez San) has said
that although he does not consider the TOM RISC chip to be a true
64-bit chip, he does consider the Jaguar to be a 64-bit system.

According to Sega, it will be in Japan this xmas. The base unit is
scheduled to cost $500 - at which point it will face the same problem
the 3DO currently has (though with Sega's marketing, it will probably
still do very well).

I'm not saying that Sega is sunk, just that there is a wide enough
hole for the Jaguar to gain large marketshare.

>

They COULDN"T deliver - they had only 50,000 T&J chips, and early
manufacturing problems to boot. There is still time for them to pull
through, though.

And then you forget that the very same developer said that he
considers the system as a whole to be a true 64-bit system - the issue
really at stake.

>
> I pointed out from the same source, that the 68000 was in fact
>the main CPU - the designer himself said that the other chips werent
>for main system processing - got any problems with that?
>

Misinterpreting, you make this claim - but this is not what was said.
What was said is only that the TOM RISC chip is slow outside of its 8k
internal memory - not that the 68000 was the sole CPU, or that it had
to be used as such.

>>Tell us just what a system must have, in your opinion, to be a 64-bit

>

Both, to a certain extent. Look, I'll back off of the RISC chip being
a full 64-bit chip - but the Jaguar as a whole is still a 64-bit
system.

Nope - the blitter does all of the g-shading, and does Texture Mapping
too. These are all simple linear interpolation type things, that are
easy for a blitter to do.

When the 16MHz 68030 has less than half the memory bandwidth.

I must point out that the PC version of Cubase is still way behind even the ST version, never mind the falcon Cubase Audio. There are serious problems with timing accuracies is windows sequencers anyway (see the Future Music review of Cubase for Windows).

If anything, the platform to go with for music (if you don't want an Atari) would be the Mac, which has Cubase Audio as well....

>has probably climbed by now. When 50% of code runs on each processor,
>how can you claim either one is the sole CPU?

I seem to remember he DID. Has anyone got the text to hand? He said
something about the RISCs being slow out of their caches and that the 68k
was there as the CPU because the support chips were not suited to that
sort of work.

>Now there's a rich one, Gavan talking about fact... would that be the
>same false "fact" where you stated the blitter does not do g-shading?

So the blitter goes away and does ALL the stuff needed for Gouraud
Shading on its own? You just say, `fill this area here with g-shading` and
it does that? I doubt it, probably some of the blitters muscle power is
used to speed up the process, but somewhere along the line one of the
other chips must be doing a lot of the work. Ditto for texture mapping.

>> Notice how often the phrase `32 bit` pops up? The bus is 64 bit,
>>but the much vaunted RISC processors are what we techies call `32
>>bit`.

>The phrase pops up twice... and although the data manipulated may be
>32-bit quatities, what matters much more is the size of the bus - that
>is where things will get held up.

This is the same group where Falcon owners were claiming that the
16-bit databus from the 030 to memory DIDN`T have any negative affects on
the performance of their machine?

If you want 64-bit power, you need true 64-bit chips. As I have said
repeatedly, the 64 bit data bus in the Jaguar is GOOD as it minimises DMA
contention and is a plus point. It doesn`t however qualify the machine as
64 bit. If that was the case, then the humble A500s and STs could be
called 24 bit (as the ADDRESS BUS in those was 24 bit). Its the internal
registers and making sure that they have a full datapath to memory thats
important here.

>You mean 64-bit - but I relent on this point, and will not call the
>TOM RISC chip a true 64-bit chip - just a 32-bit chip with some 64-bit

>access features.

Thats a more sensible way to describe the chip.

>> No, I say judge the FACTS before making a decision, dont spend
>>your money based on what a fanatical group of computer-groupies tell
>>you. I`d say you are the one who is blindly following a line.
>>

>And I'd say go play games on the system, rather than trying to

>who fanatically and blindly attack a system.

Where have I `attacked` the Jaguar? If I said `jaguars are crap , go
buy a cd-32 its much better` THAT would be an attack.

I simply pointed out some of the lies and hypocrisy we see floating
around this group, and immediately Atari owners like yourself, paranoid
from past Atari failures and desperate not to see the Jaguar go the way of
all things Atari, jump on me and see my comments as an attack. I call it a
REALITY CHECK.

>What lies? The Jaguar has a good, solid claim to be called a 64-bit
>system. Even the very developer that you so love (Jez San) has said
>that although he does not consider the TOM RISC chip to be a true
>64-bit chip, he does consider the Jaguar to be a 64-bit system.

Sorry, but I`m not the one quoting Jez San. I quoted the actual guy
who designed the Jaguar. He described the chips as 32 bit in nature.

Your postings are largely based on paranoia. Anyone who dares question
the mighty sales literature of Atari is obviously a revenge crazed Amiga
owner. Why Amiga owners are supposed to be revenge crazed, I don`t know.
After all it has wiped out the ST/Falcon line and put Atari in the dodgy
financial situation it`s in now. I can see why you are so paranoid, but
don`t worry - maybe the Jaguar will suceed despite Atari and they can once
again be a leading GAMES company, even if noone buys their computers.

Maybe you should ask Rickard troedsson for details of how to do that.
over the summer he claimed that since the Falcon had a 32Mhz bus, the
16Mhz CPU could somehow read two 16 bit words in one clock cycle, and
therefore had the equivalent of full 32 bit access.

FYI, the A1200 chipset CAN do 64 bit DMA using some sort of `burst
mode` and DOES have some 64-bit internal registers (you now have 64-bit
wide sprites for example). Of course, noone is claiming it is 64 bit, so I
think you should stop trying to claim that the Jaguar is 64 bit because
some of its chips can do a 64 bit fetch. Read the post from the attentio
to detail guy about the 64-bit fetch, and also read the one about the
Blitter NOT being able to do things like barrel shifting 64 bits at a time.

>>So by your own definition, the jaguar has a processor which is at least
a
>>64-bit processor. Period.

>No! See above.

So the Blitter CAN`T do things like 64-bit shifts either.
Anyone know if it can do logical operations on 64-bits at a time?

>>Can we end this silly debate?

>Good idea!

yes, a very good idea.

Look, the Jaguar CHIEF DESIGNER has described the RISC chips as being
32 bit, he also pointed out that the 68k is the CPU and we KNOW it is 16
bit.

The Attention To Detail person has pointed out that you cant read 64
bits in with ONE instruction, so that arguement is out the Window.

And Johan above says that (as I thought) although the blitter has 64
bit access, it cant manipulate 64 bits at a time for things like shifting.

I think thats well and truly shown that the Jaguar is 32 bit. 64 bit
memory bus for certain chips, yes, but not enough to call it a 64 bit
system.

ATARI JAGUAR - 32 BIT INTERACTIVE GAMES CONSOLE.

might be an altogether more honest sticker to put on the box.

Gavan.

>Or a 7MHz blitter a 16 MHz blitter?
>And of course there is the 56001...

> /
>/ Daniel

It outperforms the 030 when the 030 has to share all of its RAM with the custom chips, down a 16 bit path, and the 020 has zero wait state access along a full 32 bit data path to it`s RAM. Its not the base A1200 configuration , but then the base Falcon config is 1Mb so in both machines you are looking at expanding the RAM to at least 4 meg.

The facts are you can get a 6meg/80HD/SCSI A1200 for the same price as a 4meg/65HD/SCSI/DSP Falcon. The Falcon clearly has the advantage of 16 bit sound with DSP, but then theres not a lot of software out for it, and the A1200 has STACKS with an extremely high level of compatibility with older Amigas at a hardware level.

Of course, the average punter will probably go for a 486PC at this price level, and existing Atari-heads and Commodore-heads will just buy whatever machine `their` company brings out next.

>timings
Contention isn`t an issue once you expand beyond the base 2Mb of ChipRAM using a 32 bit FastRAM expansion. The only way to allow your programs to run without RAM contention on a Falcon is to buy one of those boards that plug into the 68030 and 882 slots to give a hacked version of fastRAM. Kludge city.

Assuming that blitting large parts of screen memory about is necessary, I`ve no idea of the timings but i`d say that the A1200 timings should be competitive with the Falcon. If you were using the CPU to do the moves, the A1200 will be faster as it has full 32 bit access. If you were using the blitter, well I dont know how effective the Falcon blitter is, but in the A1200 its more or less the same speed as blitting using the CPU.

Of course, the nice thing on the A1200 is that your PROGRAM code will not have to deal with the contention assuming you have FastRAM (which for the cost of a typical Falcon, it WILL) whereas on the Falcon, the whole system will slow with gfx DMA contention. You see, the Amiga was designed from the outset for multitasking, and so things that Atari have only just discovered like co-processors and pre-emptive multitasking, were on the Amiga from the outset in 1985 whilst Atari were making sts with CP/M 68k (TOS) and NO processor support (the ST, STm, STfm).

>I did indicate that there is about 70% contention in this mode on the
>1200,
>and about 40% contention in 320*200 * 256.... which is really quite
>poor..

I`m not so sure there is any contention in the 320x200(or 256)x8 bitplane mode on the Amiga. The original design allowed 320x200 with no contention, then with AGA and 64-bit DMA came a `4x mode`. This has to be explicitly enabled (I`m not sure how as I`m not a system coder) but once it is done you can quadruple your DMA bandwidth. The upshot is a contention free 320x256 256 colour mode, but obviously if you start kicking in vertical and horizontal overscan you will get contention. Also, you don`t say what refresh rate you were using. If you use the 30kHz horizontal refresh rate you`ll find a lot more contention than the tv-standard 15Khz rates.
>i'd hate to see the figures with the blitter and copper going... *bye
>bye CPU!*

How does the copper on the Falcon cope? Oops, I forgot, there isn`t one!

Amazing. A NeXT user flaming someone else because the other platform
has managed to sell even fewer seats than NeXT. That's like a hobo
criticizing a street beggar.

Hello. I seem to remember Bob Brodie stating that a Power PC built around the Jaguar chipset was something that Atari was looking into. So, I'd have to agree with Rickard that a great Atari computer could still be on the way.

>configuration , but then the base Falcon config is 1Mb so in both machines
>you are looking at expanding the RAM to at least 4 meg.

No.. only the CPU has 16bit access to RAM, all the CUSTOM chips have 32bit access. And don't gimme any rubbish about FAST RAM solving all the Amiga's contention problems, because most games will want to write to CHIPRAM to draw their BOBS and stuff, and will suffer the horrendous contention in any decent video mode. Fast RAM helps with processing but not with drawing to the screen. Its a shame that the CD32 has no FASTRAM though.. (laugh).

> The facts are you can get a 6meg/80HD/SCSI A1200 for the same price as a

>sound with DSP, but then theres not a lot of software out for it, and the
>A1200 has STACKS with an extremely high level of compatibility with older
>Amigas at a hardware level.

some facts for Gavan to think about:

As well as 16bit sound, it also has a 16bit stereo sampler, High density disk drive, LAN, MIDI, two analog joystick ports, DSP port etc.
The Falcon also has very high compatibility, I have very little ST s/ware which does not run on my Falcon with the exception of demos.
You also need to add an MMU or 030 to run a protected operating system.

>Gavan

Have you noticed how Gavan's last time is remarkably close to the word 'MORON'.

I quote hard facts - you don't.
I'm afraid - 'it probably would be competitive with the Falcon' just isn't good enough for me -> you lack the technical knowledge and have no grounding for your arguments.

Are you a dithering fool? John Major lookalike?

The phrase 'I'm not sure' doesn't serve to make me believe you, even more so when I program both machines and *know* that the Amiga suffers worse contention than the Falcon. As for the '4x mode', me and some Amiga demo writers did some timings and it effectively gives you a 1.4 improvement in speed over an a500! Blitter line drawing and suchlike is not improved.
The AGA h/ware was a quick bodge just to fill the GAP between ECS and AAA.

yawn.

> Also, you don`t say what refresh rate you were using. If you use the
>30kHz horizontal refresh rate you`ll find a lot more contention than the

The AMIGA will suffer more contention in than the Falcon, ok?
If you want to write to the Screen it will be slower than on a Falcon in a high video mode? OK? comprende?

> >i'd hate to see the figures with the blitter and copper going... *bye
>>bye CPU!*
> How does the copper on the Falcon cope? Oops, I forgot, there isn`t
>one!

yawn, no... the copper is nice for a games machine, the Falcon doesn't try to be a games machine, however the 16++mips of the DSP 56001 more than make up for the lack of a copper, besides which the '030 can do everything that the Copper can do. Copper use is also not free - it adds to contention.

>|> The Jaguar is not a general purpose computer and cannot easily be compared
>|> to one, a computer that has ONE CPU, and genrally few graphic chips.

>No, it's a toy.

Correct. As are most consoles.

>|>
>|> The Jaguar, and most modern consoles, are complex machines, with power being
>|> directed away from logical computation but towards graphical manipulation.

>What a concept. The Amiga was doing this in 1985, it's not new you know.

Not to the same degree. Most games written for the Amiga, rely mainly on
the CPU to run the game, with help from blitters and other DMA devices.

The Jaguar, if you took the time to study it, does not have the same
dependence on the CPU.

When I say 'run the game', I refer mainly to graphic 'work'.

>|> I think your continued use of the single CPU architecture to justify
>|> your obvious hatred of the Jaguar is misleading, and quite frankly, I
>|> tend to bleieve your knowledge of such systems is lacking.

>You believe wrong, after all, I use one every day.

Well, to be bluntly honest, you dont seem to know that much about
the Jaguar judging from your posts. For example, you keep
reffering to the 68000 as the main and only CPU, and winge
about the term 64-bit SYSTEM, when that is exactly what it is.
If you dont agree, then let's agree not to agree, because
no matter how much we rattle on about it, Atari are going
to rightly hammer the 64-bit part of the Jaguar in their
comercials and presentations.

>|> Facts are that the Jaguar is more complex then a sinlge CPU architecture,
>|> and has more than one CPU.

>That's lovely, and the one which runs the program code is 16 bit. The ancillary
>processors (there is only 1 CENTRAL processing unit in the Jaguar) are 32 bit. It
>doesn't have a 64 bit MPU.

There you go again, bringing general use computer term to bear in a conversation
with nothing to do with it. Ever hear of parallel processing?

The term CentralProcessingUnit is growing out of date.
The Jaguar has TWO functioning PROCESSING units, both capable of
logical and arithemtic operations. Fact.

Do you agree?

>|> Atari would be hugely stupid to ignore the 64-bit bus inside the Jaguar
>|> when advertising the machine. Any who winge at the sales man's use of
>|> the term '64-bit system' is

>Sigh, pick the largest bus in the system and decide that that is the 'bitness' of
>the system. It's a cheap marketing ploy. but hardly terribly accurate. Wouldnt
>mind so much if it weren't for the double standards, ie:

>If the Jaguar is 64 bit, then the Falcon is 16 bit.

>If the Falcon is 32 bit, then the Jaguar is 16 bit.

>Which one is it to be?

The Falcon has a 32-bit bus.
I can see where you're coming from, but still you throw in
inaccuracies, such as ignoring the fact of the 32-bit bus in the
Falcon.

Listen, the days of the ONE cpu, ONE width data busses are gone.
The modern day consoles are not as arcitecturally simple as they
used to be. You cant use an old stick to beat a new machine.

Your not go to let me off? (laugh), you admit then that an 020 is worse than
an 030 at a software implementation of floating point. And you try and suggest
that I don't know what I'm talking about in terms of the Falcon's DSP.

WRONG!
WRONG!
WRONG!

A S/ware implementation of FP arithemetic on a 32mhz DSP56001 is as fast as a
16mhz 68882 , as fast as 20mhz for some operations.

(you really are an uneducated fool, please think in future before you post,

Its kinda tiresome having to show you up like this all the time)
here is the FP ADD subroutine to prove it:

```
;-----------------

; This program originally available on the Motorola DSP bulletin board.
; It is provided under a DISCLAIMER OF WARRANTY available from
; Motorola DSP Operation, 6501 Wm. Cannon Drive W., Austin, Tx., 78735.
;

: Why is AGA more impressive than the Falcons Video chip? The Falcon has more
: video bandwidth, True colour (no 8 bit kludge's here...) etc.

The 'kludges', as you put it, are only in AGA for backwards
compatibility with older systems. This will be gone in the next chipset. It
doesn't make sense to alienate the few million Amiga owners with
older machines by releasing a system that isn't even backwards compatible.

Besides, with todays's ram prices being as they are, HAM8 is far
more conservative on memory usage (8 vs. 16 or 24 bits for similar # of
colours), which lets you use memory for other things.

: What is better about AGA? its lower bandwidth, lower refresh rates? or
: that wonderful(laugh) HAM mode, no perhaps its the video contention being
: twice as much as the Falcon that makes it better ;-).

AGA is actually being used for far more than ~20,000 systems.

It has far better bandwidth than OCS/ECS. There is virtually NO
video contention when displaying ALL video modes, including HAM8. Like
something on the order of 0.05% on average. (It's been a while since I
saw the specs) And this is without the use of dual-ported VRAM.

As for HAM6 or HAM8 modes, well they're perfect for full-screen
real time animations (video CDs). And fringing is almost invisible.

: Funny that, I don't see 'Pure C' for the Amiga.... and we have the best Amiga
: compiler (SAS) on the Falcon too. And believe me Pure C 2.0 (Borland) walks
: all over SAS in every way.... ooopppsss sorry that can't be right, after all
: the Falcon has no s/ware support ;-).

What the heck is 'Pure C'? Is that supposed to be something
similar in concept to 'True Basic'? <smirk>

If so, then who would want it.

Atari has not committed on any future computer design. The have said that
they are looking into a computer that is designed with the Jag set in mind.
Whether or not that happens is anybody's guess. My personnel opinion is
that Atari should concentrate on the video game market. Neither atari or
commodore will ever get sufficient market penetration to become a large
computer player. Atari does stand a good chance, as long as they don't
make stupid mistakes, of penetrating into the video game market with the
Jag and ought to concentrate their resources there.

A fast processor needs data to feed it as well. What has this
been used for other than audio processing, especially with its slow 8-bit
port?

>basically an 030 is blown away by a DSP... certainly more than 16 times for
>most multiply/accumulate type sequences. People just don't realise how good
>these chips are at what they are designed to do!

I think I would know what a 56k is good for since I designed and
built a board around it.

>> Useless since the normalization is good only for fixed-point
>>math (FP normalization is different) at a limited resolution (<24 bits).
>>

>The set of FP routines supplied by motorola (from the Dr bub BBS) use
>the 'norm' instruction extensively in their implementation of FP...

Okay, this I didn't know. I was wrong.

>I think in this implementation a 'float' multiplication takes about 51
>cycles... which means a 32mhz DSP 560001 would be equivalent to a 20mhz 68882.

>which is quite a bonus really.(and these routines are not necessarily optimum.)

Unfortunately, though it may be faster for data in its local
memory (or almost as fast, whatever), a 680x0 can access a 68882 much
faster than it can the 56k.

>How would you like to list the results : as a 68000 listing which we can then
>compare subjectively? IMHO Pure C seems to produce 'better' code than
>the other compilers I've used (Gcc/Lattice).I think there are plenty of people
>who will back me up on this. Why would I lie about which compiler is better?
>after all I write in assembly most of the time!

I'm sure you're not lieing, even if I might have implied it
before. In the code I gave you, SAS/C 6.51 could have done 3 things
better. An expensive commercial compiler gets two of these things
(loop rotation and heavy usage of registers), and I'm just wondering
how good Pure C is. In case you want to try it, make every variable
local except for struct Edge *EdgeActive, and I forgot to add the local
variable int i. The comparisons I was doing was for a 68030 so Pure C
should be told to generate 030 code. Thanks in advance.

Gavan,

Will you please learn to read more carefully? Johan was talking about
the barrel shifter in the GPU (contained in TOM). Since the GPU has
32-bit internal registers, it has a 32-bit barrel shifter. Do you
even know what the GPU is? It's a 32/64-bit Graphics Processing Unit
that is optimized for 3D graphics algorithms. From what I've read,
it's very DSP-ish. It's very fast at multiplying arrays (which is

needed for performing 3D transformations) and is the main reason why the Jaguar is very good at polygons.

As far as I know, the Jaguar's 64-bit Blitter really can operate on data 64-bits at a time. In other words, it can perform 64-bit shifts and do logical operations 64-bits at a time.

The custom chip TOM contains both the 32/64-bit GPU as well as the 64-bit Blitter and 64-bit Object Processor (supposedly a very advanced Sprite Engine and Display List processor).

That's interesting. Can you plug your Falcon into a Mac or PC network?
Does atari actualy produce drivers and LAN compatibility built into the
operating system? Can you say log onto another machine and run programs
off the servers hard-drive?

Has the digital joystick ports been removed? I know you can plug an
analogue joystick into the Amiga's joystick ports with a small $10
adaptor. You can even get games that actually support Analogue
joysticks ;-)

The Multiply is not INTEGER it is a fixed point 24bit multiply
with 48 bit result (in this case the 48bit result is added to a 56bit total).

>>which would take about another 4-6 cycles on an 030.... then again the DSP

It is useful for a lot of things, the parallel nature of the DSP can be
exploited for EVERY algorithm I have written on the DSP so far beit graphics
or sound.

>>The set of FP routines supplied by motorola (from the Dr bub BBS) use

Well the DSP can feed the CPU data as fast as the 030 can take it....
you have to add about 8 cycles or whatever it is to send/receive the data,
but then again, a 68882 would have to access the memory too.

you get about 2meg /s over the HOST PORT, I'm sure you'll realise that you
couldn't process 2meg/s of floating point data, even with this mighty DSP so
transfer is not a problem.

My experience is based on MY subjective opinion of the code produced by PURE C,
it looks faster,cleaner and generally BETTER than the code produced by Lattice
/Gcc etc.
When I get some time I'll compile that code and post the object code produced.

>--Andre

IMO Andre you are about the only Amiga advocate here who seems to have any
common sense. I wish more were so level-headed and not quite to spout rubbish.

} Does atari actualy produce drivers and LAN compatibility built into the
} operating system? Can you say log onto another machine and run programs
} off the servers hard-drive?

Atari apparently (according to Bob-B) got a firm to write a network extension to TOS, they tendered a quote, and that was the end of it.

However, you can use powerDOS to plug into appleTalk LAN's (The port isn't ethernet, just an appletalk connection).

It's a pity the networkability hasn't been improved on. I know there are now hooks in MultiTOS for network code 'cos its in the low-level kernel stuff (MiNT) that we've all compiled at home :-)

As a side issue, Eric Smith definately *hasn't* resigned from Atari (as I saw here earlier), he posted stuff to the MiNT tech mailing list earlier today. And he has a netcom account because Atari don't (for better or worse) maintain an internet presence. Good news people, MiNT 1.10 next week and 1.11 soon thereafter...

} Has the digital joystick ports been removed? I know you can plug an
} analogue joystick into the Amiga's joystick ports with a small $10
} adaptor. You can even get games that actually support Analogue
} joysticks ;-)

The digital ports are still there, but there are 2 15-way analogue ports as well. There are also loads of digital inputs on the analogue ports, I had a small network thing going a few years ago between 2 STe's (they have the ports as well), which used a 16-way ribbon cable and an interrupt driver to transfer data. Basically I took an existing program (midiNET) and added my stuff - I was getting transfer rates of ~1Mb/sec along the ribbon cables, but they had to be short :-)

ATB,
Simon.

Several points. Firstly the CENTRAL PROCESSING UNITS were being discussed, not the graphics datapaths. This seems to be a typical tactic in this group, if the argument isn't going your way, then pretend we were arguing about something else.
Secondly, BOBs are updated by the blitter, not the CPU (you do know what BOB stands for, don't you?)
Thirdly, games run in 320*256*8. I realise this may be a decent graphics mode by Falcon standards, but as far as the A1200 is concerned it isn't.
Fourthly, there are FAST RAM cards available for CD32

|> As well as 16bit sound, it also has a 16bit stereo sampler, High density disk

Pity it's not very good (Wordworth III anybody?)

|> which does not run on my Falcon with the exception of demos.
|> You also need to add an MMU or 030 to run a protected operating system.

And you need something other than a Falcon to run a decent personal computer operating system anyway. (MultiTOS is meant to be a joke, isn't it?)

Utter drivel. You said the Falcons DSP can do FP as fast as a 68882. That is not a hard fact, it's a blatant lie.

No, you again prove that you have no clue what you're talking about, There is no bus contention in 320*256*8 mode. Gavan is quite correct.

|> The AMIGA will suffer more contention in than the Falcon, ok?
|> If you want to write to the Screen it will be slower than on a Falcon in a
|> high video mode? OK? comprende?

Sorry, but again, that's crap. The Falcon will be slaughtered by contention in comparison to the A1200 because the Falcon, being a 16 bit machine, takes almost twice as long to do a memory access as an A1200 in the first place.

The Copper implements multiple dragable screens, widely regarded as one of the
Amiga's strongest features. You really are not doing terribly well are you?
(BTW, I find being lectured by a Falcon advocate on memory access rather amusing.)

>therefore had the equivalent of full 32 bit access.

If you don't think this COULD be done, you do not understand computer
architecture well. You could have this setup:

16Mhz 030 <--> 32MHz memory controller <--> memory
32 bit 16bit

The second 16 bit bus would be the real "bus". The memory controller
(or bus controller) would be able to read two 16 bit words and
latch them for the 16MHz 030. True there would be a 32 bit path from
the controller to the CPU, but it is an 030 afterall.

Without the 32 bit bus, this could still be done if you made a custom
030 with the 32 bit "memory" controller inside, and then you would
have only 16 data pins, but be able to read 32 bits per CPU clock.

Atari does not do this. They simply only use 16 of the data pins to go
to the memory, and use the pin on the 030 that senses bus width to tell
it it is 16 bits.

> FYI, the A1200 chipset CAN do 64 bit DMA using some sort of `burst
>mode` and DOES have some 64-bit internal registers (you now have 64-bit

>to detail guy about the 64-bit fetch, and also read the one about the
>Blitter NOT being able to do things like barrel shifting 64 bits at a time.

It is still reading 32 bits at a time. Hell you could do 128bit
DMA and have a 16 bit bus, using burst mode and so on. You are starting
to get ridiculous.

The Jag HAS 64 data lines on the board. That is often the most expensive
part (i.e. why the Falcon only has 16 bits, but uses a 32 bit cpu).

According to the posts I've seen here, the Jag can not do many 64 bit
operations. It CAN DO 32 bit operations. To call it a 16 bit is
ridiculous.

I guess everyone here is too young (???) to remember the difference between internal and external "bit-ness" (to coin a word from here). Remember the ST is a 16/32 bit machine?? SO is the falcon because Atari ignored 16 pins! :-). The Amiga is 32/32. The IBM PC 386SX is 16/32. The 386DX/486/Pent 32/32.

SO . . . maybe the Jaguar is 64/32!

(In case you didn't catch it, first # is external bus, second is size of registers and internal operations).

So you folks who are claiming an apparent lack of consistancy with the Falcon and Jag bitness: 16/32 and 64/32 respectively.

I don't think I will even bother answering the statement (not by you Gavan, I have started to generalize here) "The Jag is a 16 bit machine." It is fairly obvious that people saying that are simply (a) ignorant or (b) unable to say anything without slandering Atari, even if they have to bend the truth.

You can get them, but will they work together with the software you have or
want to buy? In some cases they will, but you'll find also a lot of programms
not supporting this special card (especially if you get a DSP-Board).
If you got the Falcon you won't have problems with programs - they're written
for this machine. And if the Falcon is to slow for you - just speed it up
there are real 32 MHz boards arround (with FastRAM) and a 040 Board comming
out soon.

SG> be short :-)

Would you be interested in keep programming on that network?

Reason being: I need to get a network running either between an STE and a Falcon, or two STE's *VERY SOON* now .... MIDI is not up to it, and the commercial LAN/DMA solutions are too expensive!

I suppose this network solution doesn't ruin the CTS interrupt on the MFP as a MIDI network does? (Users can't upload if I use a MIDI network)

I'm *VERY* interested in what you've got, as I suppose many others are too!

(Whether that 1Mb/s was Megabyte or Megabit doesn't matter, 128Kb/s is what I need)

I suppose the "short" thing is because the cables weren't shielded!? If not, how short is "short"? (I've got about 1.5-2 meters between the computers in question)

>at the same time, seperatley...

hmmm. what is it about Falcon onwers who cite the A1200 base machine
as being 2 meg chip only, and then carp about having 4 Mb and a 65Meg HD
as `standard`?

The fact is that you can buy both machines in a mimimal config. In the
case of the F030 you can buy one with only 1 meg RAM and no HD for
anything upwards of 500 UKP and an A1200 upwards of 270 UKP depending on
source. However, Falcon owners always claim that their minimum config is
for `expansion only`. Whats the point when you can get a 4 Meg /65 Falcon
for 800 UKP? The fact is that the `base` 1 Meg model is there to try to
get ST owners without a lot of cash to spend, to upgrade. In this sense,
its valid to say that this is a proper configuration. Lets just say that
you are advised to upgrade both the base A1200s and Falcons if you want to
achieve anything like the potential they can deliver.

So please Falcon owners, if you insist on comparing base configs and
point out that your Falcon is faster than an A1200 with no FastRAM, then
ask yourself if your Falcon would be quite as useful with only 1 meg of
memory...

Leaving aside the fact that the ECS Amiga has a LOT more software
available for it than the old ST did, wasnt there a thing about the Falcon
being very INcompatible with non OS-legal stuff? I`ve heard about some
sort of software hack that lets it run some older ST games, but
considering there is an 030 instead of a 68000, and a totally different
set of gfx chips, I`d be surprised if the compatibility was more than 60%
at MOST on games. As for serious software - the old, ugly single-tasking
GEM/CPM 68K against nice pre-emptive multitasking AmigaDOS - ho ho ho!.
Its good to see you Atari types have finally caught on to multitasking (8
years after the Amiga had it) with MultiTOS. Shame its so slow and
incompatible with older software though...

Actually, YOU should get your facts straight. Perhaps I should have
specified things more carefully. About a couple of months back RT claimed
that you could use the 2 byte addressing of the Falcons 65k colour mode in
order to create two 256 colour playfields. Of course, Ricardo and I
`educated` him. I also `educated` him about the fact that a 16MHz
processor couldnt read data at a 32MHz rate, even if the bus was 32Mhz.

>Don't you think your first sentence says it all -> don't you think that

See my previous post of FP source, which basically shows what a silly little
boy you are. It is no lie, the DSP in the Falcon can be used as a 'free' maths
co-pro, indeed I think several companies are working on FP DSP libraries for
their C compilers, the DSP is worth about a 16-20mhz 68882. OK?

>No, you again prove that you have no clue what you're talking about, There is no
>bus contention in 320*256*8 mode. Gavan is quite correct.

No , don't change the subject, the Amiga will suffer greater contention in an
equal screen mode to the Falcon. You know ,I know it.

>|> The AMIGA will suffer more contention in than the Falcon, ok?
>|> If you want to write to the Screen it will be slower than on a Falcon in a

No... in high resolution modes, say 1280*256 in 256 colours the
CPU is just about locked out of writing to the screen, the Falcon is not,
the main reason why the Falcon suffers less contention is dues to its BUS design

>The Copper implements multiple dragable screens, widely regarded as one of the
>Amiga's strongest features. You really are not doing terribly well are you?
>(BTW, I find being lectured by a Falcon advocate on memory access rather amusing.)

yawn

You don't need a copper to do this, you can do this on just about any systems
which support HBL interrupts. Are you saying you would rather have a copper
than a 16+ mips DSP?? (since this is again the original question which you have
changed again). I'll respect you if you would rather a copper chip since it
makes platform games somewhat easier to write ;-).

I'm glad you use the word 'lectured', it shows I'm educating you. albeit slowly.

>Gavan

At a hardware level, the Falcon has 95% of the ST hardware registers, as well as all the new ones. The Falcon is much more compatible than you would think, the reason most games fall down is because of the 030 and protection which on the ST was often particularly reliant of screen h/ware timing.

As for Operating systems:
at least Gem has the VDI. Does the Amiga have anything like the VDI? I only program them at a H/ware level so I can't really comment on the Amiga OS, I have to say though that I think its disk system is pretty slow, you watch it draw a directory even from a fast hard-drive.. hmmm..

as for MultiTos, yes it is slow, compatibility is not so much of a problem. It is getting better, 1.08 is pretty stable and actually quite usable.
have u actually used it? I think not, JUST ANOTHER MINDLESS ATARI SLAGGING.

What has RT got to do with me? You are picking on the wrong person?!
are you seeing that just cus some other guy was wrong that I am wrong too???

Gavan you really are small-minded, I am infinitely more knowledgable than you.

You say Ricard and yourself educated him? how do you know what the Falcon can do?? I gave the two 256 colour playfield idea a quick thought and it can be done with the DSP, no trouble at all. The only disadvantage is that the update would be 25 Frames per second and each 256 colour playfield would only have a 16bit palette -> I will explain the technique in more detail if you really want me to. Never say that anything 'cannot be done', most things can be done but its the speed at which they can be done that counts.

I've only been on this group for a little over a week, so I can't comment on the 16mhz thing.

426. the end ?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-02-10 14:07:00 UTC
From: rz2a024@rzaix02.uni-hamburg.de
Message-ID: <2jdf24$ptl@rzsun02.rrz.uni-hamburg.de>
Source record: 19027

hi everyone,
after reading dozends of silly an kiddy posting, i would
like to add one more. And i would like to ask the
question, how long will Atari go on.
Here in Germany, two of the three most important Atari-journals
gave up. No more readers.
(It seems to me that one of these journals, called the
"ST-Magazin" is now the "NT-Magazin"...)
Well, but why do i think, that the end has come (sooner or later).
- if you really work with computers (at university, or worser, in
the industry), you will nearly *NEVER* find a atari-computer.
So - if you have to earn money by writing programms (like i do)
or dealing with these machines -> throw your atari away, no
one wants to have these machines.
HARDWARE
- atari (the ST-serie) was a great deal in 1985, in the days of
8086 and 80286. But this is NINE YEARS AGO! Now it is the time of
80386/40 (minimum), normaly 80486, or PowerPC, Pentium, Alpha-Chips.
No chance for an (old) 68030, with 16 Mhz.
- the price is extremly high (here in Germany: falcon, 14 MB, 80 HD (joke)
is about 3000 DM) What a brainless price! A better 386, with color-monitor,
with 300 HD, including some programms, is about 2000 DM.
Why should anybody buy a atari-falcon ?!? Because of the DSP. If I need
one, i can buy one on an extension card. And please tell me: which
programm supports the DSP on Falcon? Yes, one or two (ok, some more) music-
programms. But how many musicians are there, who wants to buy a Falcon.
(Prust: HD-recording with a 80MB-disk.)
- ataris marketing is, somehow, brain-dead. The good old atari-users,
who wanted to buy a falcon, didn't get one, or had to wait for MONTHS (here
in germany).
SOFTWARE
- the atari-software is not on the same level, as the software on the
PC-machines is.
Also, the nice and experimental OS'es just like LINUX, are only available
for 80[345]86.

Well, i think thats enough for the moment...
Please, don't reply directly to me, because there is enough serious mail
i have to read, so follow up with yout rubbish in this group.
(Faellt eh nicht auf)

Best wishes, viele Gruesse,

Friedemann

|> compromise is the cpu BUS ,everything else has 32bit access... If it is
|> so badly designed how come the Amiga line suffers from 3 times as much
|> contention ?

Well, the CPU is actually rather important, because it runs your programs, and the memory is rather important, because thats where the programs are stored, and having a slow link between them is not clever. BTW, my A1200 suffers from zero contention, so unless the Falcon suffers from zero contention too, then your statement is incorrect (3*x=x only when x=0). Have you any basis in reality for your claim?

|>
|>
|> >How fast is the video RAM in the Falcon? If it's faster than 80ns, then yes, it
|> >does have more video bandwidth. If is isn't, then it doesn't I'm afraid (By

|> >would imply that the RAM is the limiting factor, not the fact that the bus is
|> >1.6MHz slower.)
|>
|>
|> 70/80ns I think with 32meg /s bandwidth -> the 1200 has 26meg/s.

Wouldn't this make the maximum resoloution you could display 65536 colours in about 640*480 (non-interlaced) without suffering appaling raster flicker? I'm not terribly impressed, try 784*550 (non interlaced) in over a quater of a million colours.

|> So you are saying that you can update a HAM8 screen faster than a TRUE colour
|> one!!!!!!!!!!

Of course you can. Since a true colour screen has 24 bits of information, it takes less bandwidth to update the HAM8 screen. Even with the Falcons direct colour mode (16bit), it's still half the amount of memory to update.

|> oh my god, can I have some of the drug that you are on?!
|> Lets see you do texture mapping/gouraud/phong at 25/50FPS in HAM8... i can
|> show some of my Falcon demos which do this.

You can do HAM8 on a Falcon when it doesn't even have hardware to do this mode? I take back everything I've said about the Falcons graphics, this is really impressive!

#UNDEF sarcasm

|>
|> Yes the 1200 has a 24 bit palette, ask some amiga programmers what they would
|> prefer HAM8 or 65536 colours from 65536 with one word per pixel.

Hmm, my machine word is 32 bits. I doubt many programmers would like a mode that
wasted 2 bytes between each pixel.

|>
|> What is better about AGA? its lower bandwidth, lower refresh rates? or
|> that wonderful(laugh) HAM mode, no perhaps its the video contention being
|> twice as much as the Falcon that makes it better ;-).

Wow! In the space of one post it's gone down from three times to twice! Maybe if
I wait a few seconds more, it will be 10 times less? (Actually, thanks to FAST
RAM, there is NO contention. Again, you appear to have no basis in reality for
your claims.)

|> What refresh rate do you get at 800*608?
|> I get 104hz interlaced from my Falcon. I think the 1200 does 72hz (laugh).

Then you think wrong. (BTW, My A1200 does 784*550 NON INTERLACED in HAM8. Makes
your direct colour mode look a bit sad..)

|>
|> >Perhaps if you had an up to date version of SAS.. It seems that the nice people

>
> AGA is actually being used for far more than ~20,000 systems.

Yes, it's used for displaying pictures, displaying pictures or displaying
pictures (pick anyone you like). Anything elso on AGA Amigas is done
in normal modes.

> It has far better bandwidth than OCS/ECS. There is virtually NO
>video contention when displaying ALL video modes, including HAM8. Like
>something on the order of 0.05% on average. (It's been a while since I
>saw the specs) And this is without the use of dual-ported VRAM.

ALL video modes? The full bus contention is reached at 1280*512 interlaced,
640*480 noninterlaced, 1280*256 noninterlaced, etc.

> As for HAM6 or HAM8 modes, well they're perfect for full-screen
>real time animations (video CDs). And fringing is almost invisible.

Video-CDs don't have full-screen real-time animation, they have MPEG.
You need a full hw MPEG -> fullscreen pictures converting unit to do this
task. MPEG alone reaches approx. 3-4 fps in 256 colours - on a 4000/040!!!

> What the heck is 'Pure C'? Is that supposed to be something
>similar in concept to 'True Basic'? <smirk>

Yes, but - you know - C is a language that differs somewhat from BASIC.
The main differences perhaps are that all arguments are in brackets and
that one is not supposed to use 'GOTO'. But you will learn this somewhen.

If you're referring to the Amiga, that's because it's got a *real* file-
system, and not one of those FAT-thingies MS-DOS and its siblings (TOS) use.

>

Nope, not by your own definition - it processes 64-bits of info at a
time, via the blitter and object processor (which are in TOM along
with the RISC chip). I can't believe you haven't looked at the specs
yet, all you are doing is making a fool of yourself.

<more stuff deleted>

A great idea, let's just clear up your silly bits of misinformation first:

> Look, the Jaguar CHIEF DESIGNER has described the RISC chips as being
>32 bit, he also pointed out that the 68k is the CPU and we KNOW it is 16
>bit.

Yes, the RISC chips are 32-bit (though one does have a 64-bit bus).
But the designer DID NOT say the 68k is the CPU - ALL HE SAID was that
the RISC chips were slower outside the 8k of internal memory. Why do
you continue to live in the past?

>
> The Attention To Detail person has pointed out that you cant read 64
>bits in with ONE instruction, so that arguement is out the Window.
>

But you can read 64-bits in less time than doing two seperate reads -
just like burst mode. Still quite useful.

> And Johan above says that (as I thought) although the blitter has 64
>bit access, it cant manipulate 64 bits at a time for things like shifting.
>

An amzing incorrect interpretation of a barrel shifting argunment,
extended to cover all issues. What gall!

The subject was bus contention, is still bus contention. You do know what FAST
RAM is for, don't you? You do realise that the Falcon takes nearly twice as long
to access memory at the same amount of bus contention don't you? Something to do
with that quaint little 16 bit data bus it's got.

|> No... in high resolution modes, say 1280*256 in 256 colours the

|> makes platform games somewhat easier to write ;-).

Rubbish, the Amiga does not split one screen into several parts, they really are multiple screens, not just reconfigured parts of the same screen area. You think it's so easy to implement with your funny little HBLANK interrupts (even the VIC20 had those, we are talking ANCIENT here), you go and do it. I think you'll have quite a nasty shock.

|>
|> I'm glad you use the word 'lectured', it shows I'm educating you. albeit slowly.

You keep on believeing that.

I was ciorrecting your (typical) misinformation - did you see me say
anything about the base Amiga config? Nope. All you are doing is
attacking me becuase you cannot face the truth.

>
> The fact is that you can buy both machines in a mimimal config. In the

>for `expansion only`. Whats the point when you can get a 4 Meg /65 Falcon
>for 800 UKP? The fact is that the `base` 1 Meg model is there to try to
>get ST owners without a lot of cash to spend, to upgrade. In this sense,
>its valid to say that this is a proper configuration. Lets just say that
>you are advised to upgrade both the base A1200s and Falcons if you want to
>achieve anything like the potential they can deliver.
>

No, it is not - anyone who wants to buy a Falcon will get the 4/80
model. The 1MB version is just there for the guy who like to put a
system together seperatley...

> So please Falcon owners, if you insist on comparing base configs and
>point out that your Falcon is faster than an A1200 with no FastRAM, then
>ask yourself if your Falcon would be quite as useful with only 1 meg of
>memory...
>

I am doing no comparison, only corrections to your odd and incorrect
view of what a base Falcon really is.

>
>>> The facts are you can get a 6meg/80HD/SCSI A1200 for the same price
>>>as a
>>>4meg/65HD/SCSI/DSP Falcon. The Falcon clearly has the advantage of 16

>incompatible with older software though...
>

Your ignorance is astounding. The "hack" as you so call it, does a
great job of letting games meant for the older ST's to run - by doing
things like turing off caches, redicing blitter and CPU speed, and
other stuff. Guess what - you may not know this well kept secret, but
the 68030 was designed to run 68000 code as well!! Gasp! The blitter
is also compatible - there is no "totally incompatible set of chips".
Only Amiga would be that stupid... and even they have some backwards
compatibility, right?

70%-80% of the games I have tried work, and I have used quite a few games.

It is a bit slow (for now), but not very incompatible. And actually,
there is no question of the superiority of MTOS for me - POSIX
compatibility (beyond the scope of this article to explain to you),
real memory protection, virtual memory, and a nicer user interface

(admittedly subjective).

Here's a thought - perhaps, just perhaps, not all companies on the
face of the planet have internet connections. Further extrapolating,
we can see that a good possibilty exists that Atari does not in fact
have a direct internet connection. Here's another hint - although I
post from a .edu site, I am not actually affilitaed with DU in any way
other than using this service, and can be employed by someone else.

As for not posting the Atari name - why should he?

But many critical parts of Linux are not written in C... a lot of
stuff is evil Intel assembly. Besides, I already have almost all of
the advantages of Linux right now, using Mint.

I'm not saying that such a port would be trivial, or that all parts
are written in assembly - just that porting all of TOS or MTOS would
not be the eqivilent of porting 100,000 lines of 68000 assembly to the

PowerPC chip.

Don't you think the Amiga OS could be as easily ported to the PowerPC chip? (I don't know that much about it myself, but assume a similar situation exists).

>the performance of their machine?

I never claimed that -- odd how you keep bringing that up. And even
you must be able to see that this is the opposite situation - a bus
wider than the chips instuction.s Following your own argument, if a
16-bit bus slows down a 32-bit chip (which I'll admit does happen),
then the 64-bit bus must help improve the speen of a 32-bit chip (when
the full width of the bus can be used, which is true).

>
> If you want 64-bit power, you need true 64-bit chips. As I have said

|> 32bit memory fetches in one cycle (loud laugh)?)

The 'bitness' of a machine is determined entirely by it's machine word size, and
the size of the data bus. The I/O peripherals have very little to do with it. As
for AGA, as I believe Stephan said, there can be more than one clock in a system.
(I admit that I quoted from non-official documentation, since the C= AGA
documentation is not publicly available.)

|>

|> A 68000 running at 13mhz gives about 1- 1.5 mips, this is just for game
|> logic, which is normally trivial (most consoles use 0.4 mip processors for
|> this...). Why do we need anything more powerful? there is 50mips of 90s

To run strategy games, requiring heavy computational power? I never cared much
for Sonic type games myself. (See my comment above re quoting MIPS values for
custom hardware, you'd look very silly if you tried to run a piece of
productivity software on a graphics processor, it certainly wouldn't look
anything like 50MIPS, maybe 50KIPS if you are very lucky.)

|> VLSI in the Jag giving more power than 5 CD32s put together. The Jag
|> has 8 times more bandwidth, better sound, 32bit graphics (CD32 only has

CD32 has CD sound. It can also play over an hours worth of it continously, as
well as 4 channel 8 bit stereo overlay.

|> 8bit colour,HAM8 is useless for games)... blah blah blah... I could go

Depends on the type of game.

|> on all day, but most sane people realise that these two consoles are
|> in different leagues.

The jaguar has some impressive hardware, but virtually zero software, and that
counts for a lot. CD32 is selling like there's no tomorrow here, whereas Jaguar
has hardly got a look in. Lots of nice hardware is all very well, but if all you
can run is yet another Street Fighter II clone because you don't have enough
storage space for something with playibility and staying power, then you have
little to recomend over a Sega Megadrive.

|>
|> I just want you to answer one question :
|>
|> do you really think a CD32 could do a polygon based game as fast as a Jag?

Probably not. However, do you think the Jaguar could do a game like Microcosm as well as the CD32? Technically it's got the power, but you have nowhere to put the data.

|>
|> (Im waiting for your answer, hint the Jag can translate 5,000 vertices per VBL, a CD32 about 400).
|>
|> I had some respect for you up until now,
|> however please dont push this any furthur, the Jag wins on every
|> technical detail.

No it doesn't. I agree that it's support hardware is more cpabale than CD32's, but in terms of CPU power, storgae space, and more importantly, developer base and software availablity it looses rather poorly. It's a product that techincally deserves to suceed (as is the Falcon), but is IMHO unlikely to.

It's old (see below)

|>
|> UGLY? Do you really think that the Amiga CLI is nicer than a 256 color desktop?

This is a personal pereference thing, but I think GEM really does look dire. BTW, the Amiga Shell runs quite happily on a 256 colour screen, and I really would not dispute the usefulness of shells, as they are a LOT more powerful than a purely WIMP interface.

|>
|> SINGLE-TASKING? If I want to do multitasking I can choose between MultiGEM,

|>
|> CPM ? What do you mean? Have you ever seen an Atari?

Atari TOS evolved from CPM. That is a fact.

|>
|> NICE? Multitasking can NEVER EVER be nice without memory protection!

Quite incorrect. Memory protection is necessary for a multi user operating system, such as UNIX, but hardly necessary on a single user machine. The Amiga's scheduler is one of the cleanest around, providing near real time OS performance. memory protection actually has very little to do with concurrency, and for the most part when they overlap it is when you have to deal with problems that memory protection causes in a multitasking enviroment (eg shared memory).

WRONG!
WRONG!
WRONG!

education mode on

This silly guy seems to think that because it takes less memory HAM8 is
quicker to update, how wrong you are! If u change one pixel on a line you
must recalc the rest of the line, this is hardly quick, why do u think art
progs like Dpaint are so sllooww in HAM modes...

HAM8 is loads slower for real time apps like tmapping/gouraud/phong! I want
you to disagree with me, you are so *unknowledgable*, i code stuff like this
daily, you don't.

why don't games use HAM8??? (by your logic they should)

(laugh)

Mr Brown, please learn some amiga h/ware type stuff and u will save a lot of
face.

>|> Yes the 1200 has a 24 bit palette, ask some amiga programmers what they would
>|> prefer HAM8 or 65536 colours from 65536 with one word per pixel.
>
>Hmm, my machine word is 32 bits. I doubt many programmers would like a mode that
>wasted 2 bytes between each pixel.

Well you doubt wrong!!! Your stupidity shows through here.

You can plot a pixel 8 times faster than an Amiga with the Falcon true colour
mode , it takes 8 read/writes to plot a pixel in 256 colour mode on an Amiga,
in TC mode it takes 1 (and less logic to calculate the address/pixel mask),
so don't talk about stuff you know NOTHING about. I want you to reply to
this point -> I need a laugh!

So programmers what mode do you prefer , cast your votes!

Chunky pixels are SO useful for real-time stuff esp. 3D. OOOPSS sorry
the A1200 DOESN'T HAVE A CHUNKY PIXEL MODE , which is why games-writers and
demo-coders are racking their brains for techniques to simulate this mode.

>|> What is better about AGA? its lower bandwidth, lower refresh rates? or

>Then you think wrong. (BTW, My A1200 does 784*550 NON INTERLACED in HAM8. Makes
>your direct colour mode look a bit sad..)

NO MY FALCON DOES 1344*600 in 8bit colour, this is because it has more bandwidth - does
800*608 in 65536 colours , with each pixel being definable UNLIKE HAM8.
The HAM8 vs True colour argument is an old one, for real-time stuff I'm afraid
true colour wins, HAM8 might be better on a TV where the fringing is less
noticeable. Don't argue about refresh rates, the Amiga people who've seen
my Falcon reckon its loads better on a decent monitor than an Amiga.
You rekcon an Amiga is as flexible as a Falcon on an SVGA or Multisync? what
crystal does it have for video? I've not seen anything on a real-monitor
which remotely impresses me on the Amiga.

>|> Atari Works compares well with Wordworth III... does WWIII have bitsteam
>|> font support...
>When did you use Wordworth III? It's only been out a few days.

When did u use it then? Answer my question does it use PC standard bitstream
stuff? does it remotely compare to real WP like WORD II for windows -> I think
not.... Word processors for Falcons and Amigas are pathetic compared to PC
ones.. so why argu?

>|> Lattice 5.6 is just out actually. I think the people at Hisoft would agree
>|> with me that the Falcon is a nicer machine than the A1200. But then again
>|> you pays your money and gets your computer.
>Oh, now you speak for Hisoft do you?

Yeah, I read an interview with them in the other day, and they stated that
they prefered the ST/Falcon? OK? Doesn't mean that this is the most
commercially viable option though.

Is it really that slow?
I mean, my MPEG player that I ported from X-Windows and am slowly adapting
to the DSP gets about 3-4 fps in 65536 colours! and this is on the so called
crippled Falcon. Brainstorm have it at 12-13FPS.

Well, for battlemorph, I don't know if this is possible since we are in
a 3d world but how about barrel rolls? Like where the whole screen rotates?
Some Flashy move that would make people sit up and go "whoa!"..

If you read what you wrote above , you will just realise that you just went
back on your own word!!! you said it was utter 'drivel'... The Falcon's
dsp is standard and can do FP as fast as a 16-20mhz 882. You wanna argue this
point?

how much did you pay for the 68882?

(laugh), 50 quid me thinks. Funny the DSP is standard.

BTW I have a 32mhz 68882 in my Falcon, so i could use both in parallel if I
wanted too, but I won't embarass you any furthur with my programming ability.

>Rubbish, the Amiga does not split one screen into several parts, they really are

>it's so easy to implement with your funny little HBLANK interrupts (even the
>VIC20 had those, we are talking ANCIENT here), you go and do it. I think you'll
>have quite a nasty shock.

Tell me what can the Copper do that I can't do on a HBLANK interrupt. The
Amiga acheives multiples screens by simple writing the screen address and
res register with the Copper, you obviously didn't know this, why can't I
do this on a HBLANK interrupt? It takes about 3/4 instructions on a Falcon,
each copper instruction takes time too. I bet this use of the copper must
make the Amiga OS really h/ware independent ;-).

>|> I'm glad you use the word 'lectured', it shows I'm educating you. albeit slowly.
>
>You keep on believeing that.

And so does everyone else. (my mailbox shows this!)

There are one or two Amiga peps that I respect on this Group, I almost respect
Raist because he admits he is wrong, but you just keep coming for more...
its quite fun for me, but I don't have so much time available since I have
a 3rd year project to do (68000 remote debugger), a PHD to apply for etc.

:>and software availablity it looses rather poorly. It's a product that techincally
:>deserves to suceed (as is the Falcon), but is IMHO unlikely to.

>Chris Brown

Personally I'm not too bothered about the Success of Atari products, I enjoy
the Falcon because I believe it is *overall* technically a superior product
(sure it has its compromises). It does what I want and I get a lot of fun out
of it. You constantly slag down the Falcon in other posts and now you say
it technically deserves to succeed?? I truely think the Jag will suceed though,
it is technology that will not die, if Atari goes down, someone else with
take on the Jag hardware.

Griff.

>Its good to see you Atari types have finally caught on to multitasking (8
>years after the Amiga had it) with MultiTOS. Shame its so slow and
>incompatible with older software though...

Yeah, KillAGA isn't needed on an A1200 for old games, right?
BTW, the original Atari OS does multitask, but it doesn't do it full
preemptively. And the 'more' of software is still a ridiculous, unproved
argument by you, Mr. Moron. The quality of ST software (esp. DTP/MIDI/WP/
databases) is in general much higher than that of Amiga software.

Have a close look at Calamus SL, Chagall 4C, Cubase Audio Falcon, Papyrus
GOLD, Tempus Word pro, Signum 3.3m, Phoenix 3.0, Topics, etc. before you
claim such things.

>is about 3000 DM) What a brainless price! A better 386, with color-monitor,
>with 300 HD, including some programms, is about 2000 DM.

A Falcon w/ 4 megs of RAM and 80 megs HDD costs 2000 DM. 4 megs of RAM cost about 250 DM, the 386 also has 4 megs btw. So the things you don't get with the Falcon are 220 megs disk space and a monitor. You get: 16 bit sound card (300 DM for a PC), FAST GUI, MIDI ports, DSP, SCSI-II (500 DM for a PC).

>Why should anybody buy a atari-falcon ?!? Because of the DSP. If I need
>one, i can buy one on an extension card.

You have never had IRQ-probs on your PC? And, even the more expensive DSP boards do not match the Falcon.

>And please tell me: which
>programm supports the DSP on Falcon? Yes, one or two (ok, some more) music-
>programms. But how many musicians are there, who wants to buy a Falcon.

Look into 'Keyboard', the German magazine for electronic music.

>SOFTWARE
>- the atari-software is not on the same level, as the software on the
>PC-machines is.

:-) Have you had a look on ST software recently, or are you judging from 1989 standards? In some areas, the ST software is still of equal or even better quality than the PC software. Buy ST Computer 2/94 and have a look, or try to find a c't archive where you can search for reviews of ST software. The areas where PCs are better are spreadsheets, CAD and databases.

: one wants to have these machines.
: HARDWARE

If you want to write software for serious money then don't do it on your ST,
you can still get some money for ST software, but not as much as PC software.

If the ST doesn't do what you want then get rid of it.
There is no need to move to another machine unless it does what you want to
do better than your current machine.

: Why should anybody buy a atari-falcon ?!? Because of the DSP. If I need
: one, i can buy one on an extension card. And please tell me: which
: programm supports the DSP on Falcon? Yes, one or two (ok, some more) music-
: programms. But how many musicians are there, who wants to buy a Falcon.
: (Prust: HD-recording with a 80MB-disk.)

People should buy an Atari Falcon if it does what they want it to do.

Before buying any machine people should evaluate all the options available.

: - the atari-software is not on the same level, as the software on the
: PC-machines is.

The software I use does what I want it to do. If it didn't meet your
requirements then you will make the smart move by using something else.

PC's are great at the upper levels. The software performs wonderfully on
the correct machines. I use one at work and am quite happy. At home I am
happy with an ST.

: i have to read, so follow up with yout rubbish in this group.

}
} This is a personal pereference thing, but I think GEM really does look dire. BTW,
} the Amiga Shell runs quite happily on a 256 colour screen, and I really would not
} dispute the usefulness of shells, as they are a LOT more powerful than a purely
} WIMP interface.

Who's disputing anything? If I want a shell I'll run one in a window.
No problem. I do it all the time. And I use more up-to-date shells
than the amiga CLI (eg: tcsh, tclsh, ksh)

} |>
} |> SINGLE-TASKING? If I want to do multitasking I can choose between MultiGEM,
} |> Mag!x, Geneva, MultiTOS and a cople of others...
} |>
} |> CPM ? What do you mean? Have you ever seen an Atari?
}
} Atari TOS evolved from CPM. That is a fact.

So who uses TOS ? Anyone with an ounce of sense uses MiNT or MultiTOS
to get an API that conforms to Posix (well, not quite exactly actually
but near-as-damnit). If you need a neat programming API, then you'll
be using MiNT, if you don't then keep to TOS (it's *slightly* faster
than MultiTOS v1.08.) Unfortunately the released version of MultiTOS
is 1.04, which is pretty slow. This is giving MultiTOS an undeserved
bad name for speed.

Eventually everyone will be using MultiTOS anyway - which means that
our system will be based on the most powerful os (debatedly I suppose
:-) available...

}
} |>
} |> NICE? Multitasking can NEVER EVER be nice without memory protection!
}
} Quite incorrect. Memory protection is necessary for a multi user operating
} system, such as UNIX, but hardly necessary on a single user machine. The Amiga's
} scheduler is one of the cleanest around, providing near real time OS performance.
} memory protection actually has very little to do with concurrency, and for the
} most part when they overlap it is when you have to deal with problems that memory
} protection causes in a multitasking enviroment (eg shared memory).

He didn't say it was impossible without mem-protection, he said it
wasn't nice... I hope you will agree that it is far nicer to have the
security of a protected segment of memory for any given program,
rather than leaving it to chance that no bugs will use an int as a
pointer (for eg). ---> system crash.

You and Ricardo? I seem to remember "Stefan Boberg" ... yes, I was wrong on
that point, as I confessed in a post right after.

It's easy to make the Falcon030 32 bit, if you use a 32Mhz bus and some logic
to feed the 2 16bit words into a 32bit buffer before the CPU reads ...
(Not said it's done, but that it COULD be done)

} If you're referring to the Amiga, that's because it's got a *real* file-
} system, and not one of those FAT-thingies MS-DOS and its siblings (TOS) use.

(laugh) - MultiTOS/MiNT have loadable filesystems. I agree the MS-DOS fs is pretty crap, so I don't use it... I have a minix filesystem on the vast majority of my HD now.

Oh yes, minixfs is faster than the TOSfs (it has symbolic links, any length filenames, case dependence and you can mount one partition on another to get larger single filesystems...)

Big deal, a bunch of unix ports. There's lots of them for the Amiga as well, but most people use the standard Shell because most applications have install scripts (newer ones use the Installer program) which rely on the standard commands, pipes, etc.

>demo-coders are racking their brains for techniques to simulate this mode.

Ah, but no coders/programmers are "racking their brains" on the Falcon at
all. Well, almost none.

[more stuff deleted]

From what I've heard both FinalWriter and Wordworth III is much closer to
the top PC wp's than previous Amiga wp's. I have yet to try any of
them but...

>>|> Lattice 5.6 is just out actually. I think the people at Hisoft would agree

Lattice C isn't made for the Amiga anymore. Is it still called Lattice on
the Atari?

: >of C. Then tell me all about the edianess of the PowerPC, 680x0 and
: >80x86 processors.

: But many critical parts of Linux are not written in C... a lot of
: stuff is evil Intel assembly. Besides, I already have almost all of
: the advantages of Linux right now, using Mint.

Like what critical parts? I can recompile the kernel, or patch
levels from 12 to 15 using GCC. I don't know a single 80x86 assembly
command and have never used the TurboAssembler that came with Borland
C++ 3.1 that I own. I'm not even sure if there is an Assembler under
Linux, as I have no need for one.

: I'm not saying that such a port would be trivial, or that all parts
: are written in assembly - just that porting all of TOS or MTOS would
: not be the eqivilent of porting 100,000 lines of 68000 assembly to the
: PowerPC chip.

: Don't you think the Amiga OS could be as easily ported to the PowerPC
: chip? (I don't know that much about it myself, but assume a similar
: situation exists).

Easy, probably not, unless C= had lots more operating system developers
and programmers. Apple and IBM have spent quite a lot of time working
on System 7.0 and OS/2 for PowerPC and Taligent/Pink.

Atari it seems, has got one (Eric Smith?) os guy, who most likely hasn't
even started porting MultiTos to PowerPC. I wonder how many man years
it's going to take to port?

Who are you going to sell MultiTos to? The 15,000 folks that bought
Falcons? If Atari or Commodore built PowerPC systems, they'll have to
make them cheaper than the boxes IBM and Apple produce. Look at the
prices of Macs compared to equivalent Amigas and Falcons and then ask,
why do you get more Mac than Amiga/Falcon/ST?

Atari doesn't even seem to have their own production lines, so how are
they going to build anything cheaper than IBM? What great features
are going to distinguish the Atari product from IBM or Apple?

A DSP that's not integrated into the operating system (which IBM and Apple, plus a whole heap of developers, like Lotus, Borland are working on in the PC groups)?

A not-so-great video system (Falcon)? Even if they munged the Jag chipset into the Atari-PPC, they're not capable of displaying PC or workstation style 1280x1024x8bpp, 16bpp and 24bpp > @72Hz that lots of current PC video cards are capable of.

A LAN port that's not supported in the operating system?
Non-standard connectors?
Atari ST cartridge slot?

Perhaps they'll cost reduce and use a 16bit data bus? Or offer inferior service and warranty than their competitors?

Think about how long it will take Atari to design and implement a new system and operating system with their current resources. Times a ticking, and their's going to be lots of PowerPC systems on the market soon.

I think the end for Atari came when the made their biggest mistake with the TT, the price. It they had sold it for half the price and told people about it then they could have stollen more of the business market. Back in about '91 Atari was trying to capture businesses, but their games image got in the way. Basically I believe that they did not have enough professional software to offer, not just too many games. What happened to Unix on the TT?

What used to be "power without the price" became "yesterday's power with a price!"

I'm sure you all know the A1200 was released because Commodore crapped their pants at the sight and sound of the Falcon. So they released a rushed version of their new chipset (half finished) to try and cut off the sales. Which it didn't as those who wanted a Falcon got one and those who didn't didn't.
Same with the Jaguar, which is quite a spectacular machine and the CD32 which is just a basic non upgradeable (bar FMV) A1,200 which is only just ahead of the Nintendo/Sega current machines.

Also how can people just knock Ataris financial position when Commodork are in the same if not worse position. They had to lower the price of the A1200 by a hundres quid just to shift some boxes and get some turnover.
Why wasn't CD32 originally planned for USA ??

The Jaguar will make piles of cash in the states and then will get the rest of the world from there ...
With Commodore doing badly both in the States and Europe (bar the A1,200) then whose looking good ????

Yep, a 24 bit chunky format...

>, apparently some guy called 'Mr Brown' reckoned
>HAM8 was faster for updating (laugh) -> so if its so fast why is it that
>MPEG plays faster on a Falcon.

Bacause MPEG is a chunky format and therefore fast on machines with a chunky graphics modes(Falcon/PC). Amiga's with AGA chipset don't have chunky modes and due to this they have big problems displaying MPEG movies fast.

>Come on I want an answer, after all I thought
>HAM8 was mean't to be good for animations and lets face it, MPEG sorts the
>men from the boys.

The quality and speed of HAM8 animations depend on the format used for the animation. Using MPEG with HAM8 will be slow bacause you have to convert the chunky graphics to bitplanes and the 24 bit colors to a HAM8 color. If one uses a format where some of this info is stored in the animation (a format written with the Amiga in mind) you get a much better framerate even with HAM8.

>Also how fast does an 040 Amiga display a 640*480 Jpeg

>12-13 FPS Slow? Its faster than ANY AMIGA can play them.

Faster than an _Amiga_ CD32 with a FMV card also? =) Well, you said _any_ Amiga.

It's just that if an Amiga could manage 4 FPS, a Falcon with a chunky mode and DSP should manage 25 FPS. Then again I don't know much about DSPs, and

haven't got any idea about how usefull they are for decoding MPEG.

>My own personal
>version is 3-4FPS because I have no yet optimised a lot of the Stuff in

My 030 amiga can display a Jpeg in 800X600 16mil (24bit) colors, in under
2 seconds. It has 8,16,24 bit chunky pixel modes. And it playes Mpeg
anims in 24,16, or 8 bit fast enough to look good, I don't know the FPS
rate, but much faster then 12 to 13.

:>12-13 FPS Slow? Its faster than ANY AMIGA can play them. My own personal

The mc680x0 probably wasn't competitive anymore running Unix. Amiga
Unix also died, a little bit later than TT Unix, but it's still dead.
I think C= and Atari realized they didn't have the money and resources
to sell solutions, like Sun, Dec, etc. C= losts sales to Motorola and
a lot of other customers because they didn't have enough support.

Commodore and Atari didn't drop the prices on their 68030 boxes quick
enough, and didn't spend enough money on improving their product ranges.
All they seemed to be doing was trying to "me-too!" each other and
forgot to try to out-do the rest of the market.

yes, it replaces the TOS calls with its own, and adds the unix ones.
Most TOS calls are actually simple translations into the unix ones.
(ie: you write CConws and the compiler uses fprintf(/dev/console))
bad example, but you get the idea.

} : (for example, my MDK kit uses /bin/sh as it's installation script

The MDK (MiNT Distribution Kit) is a set of programs that'll set
your STfm ->TT up as a unix box. It contains the vast majority of
programs you'll find on a unix box, mainly GNU stuff +others. It
obviously comes with /bin/sh (therefore it copies that into /bin
and then runs a script with "#!/bin/sh" as the first line.)

In point of fact, I think installation progs can be made much nicer
if they're gooey anyway. I'm re-writing (very slowly - I haven't much
time) this in C++/Gem++.

Well, gosh, amazingly CD32 *has* the mpeg hardware available. It can do 3/4 screen motion video without one (CDXL) using HAM8, and it looks fantastic.

|>
|> Yes, but - you know - C is a language that differs somewhat from BASIC.

No MPU's???? Some mistake here? (Unless Motorola have suddenly started doing a vaulve version of the 68000)

EE> Fact is that the F030 beats the hell out of the A1200, thats why it
EE> costs more...

Actually, in the latest Atari:Dateline, Bob Brodie says something to the effect that Falcon prices will be changing and will become VERY favourable to retailers.

I'm thinking we'll see prices in the area of $800 US for a 4/65 or 4/80.

Truly Power without the Price.

>I wasn't talking about the Jaguar, I was talking about using a machine with
>multiple co-processors (A1200)

ok. Let's start from the beginning.

I asked you to stop using the single processor architecture, a SISD
type architecture, to justify your criticisim of the Jaguar. You
answered by saying you would continue, becasue you see the amiga
has 'co-processors'?????

Do you know the difference between a 'co-processor', and a CPU, where
CPU here means a general processor?

The answer is simple. They are different. The CPU can stand on it's own
and has a rich, full instruction set. The co-processor is a dedicated
piece of hardware, capable of processing a small set of data VERY fast,
and it's whole existence is to supports a CPU. It does a select group
of operations faster then the CPU it supports. One good example is the FPU.

Please stop using the Amiga architecture, in it's present state, in comparisons
with the Jaguar architecture. It's like comparing an apple to an orange, honestly.

Hello world!

I wonder if someone out there has got a TGA to JPEG converter written in C?
Or perhaps has a converter already for IBM 355 with UNIX? I've just
compiled POV-RAY for this computer but I can only look at a preview
of the picture, XV can't load TGA, but it can load JPEG.. HELP!!

Yes - there's a new package called SAW that will let you do 8 track HD
recording with the PC - you just need a turtle beach card and a huge hard
drive..

in lieu of this, the only practical selling point of the falcon (that it
can do HD recording at a low cost) seems moot. The Falcon is finished..

Unfortunately, the average consumer is pretty much brain-dead and

has little idea what s/he is buying - "oh, I need a computer.. what do they have at Sears?" Not to mention little taste for aesthetics (sp?) Up at college, there were a lot of kids with money who had computers their parents bought them to "do homework on" (like you need a $1500 PC to write an occasional term paper) - case in point.

:>>:>MPEG is a chunky format, so it's not very well suited for Amiga's.

Unless that amiga has the AAA (not AGA) chipset or an EGS graphics board,
they both have chunky modes.

:>>Mpeg is a 24 bit format

:>Yep, a 24 bit chunky format...

:>>, apparently some guy called 'Mr Brown' reckoned
:>>HAM8 was faster for updating (laugh) -> so if its so fast why is it that
:>>MPEG plays faster on a Falcon.

MPEG will play faster on a falcon then a non AAA/EGS amiga, but the same anim
will play faster on a ECS/AGA amiga if converted to anim7 format, and have
more colors.

:>Bacause MPEG is a chunky format and therefore fast on machines with a chunky
:>graphics modes(Falcon/PC). Amiga's with AGA chipset don't have chunky modes
:>and due to this they have big problems displaying MPEG movies fast.

But AAA and EGS amiga do have chunky modes.

:>>Come on I want an answer, after all I thought
:>>HAM8 was mean't to be good for animations and lets face it, MPEG sorts the
:>>men from the boys.

Ham8 is only fast if using a Ham8 compressed anim mode, like anim7.
Its faster then Mpeg on a falcon but takes more ram.

:>The quality and speed of HAM8 animations depend on the format used for the
:>animation. Using MPEG with HAM8 will be slow bacause you have to convert
:>the chunky graphics to bitplanes and the 24 bit colors to a HAM8 color. If
:>one uses a format where some of this info is stored in the animation (a
:>format written with the Amiga in mind) you get a much better framerate even
:>with HAM8.

:>Faster than an _Amiga_ CD32 with a FMV card also? =) Well, you said _any_
:>Amiga.

The CD32 plays at 30fps, but could play faster, it is held back to 30 for
smooth playback. It does not use any amiga graphics for the playback, it
has a custom graphics mode. More colors then ham8.

I have had a couple of problems with Toad as well, but I have to say this really emphatically --

TOAD == THE GOOD GUYS!!!!

Here are ten reasons why. I'd have to stop and think for a moment to come up with fifty more, but I don't have the time ;-)

1. Selling Atari Products in the present market is incredibly difficult: You have to get most of your products from small-time outfits or overseas, and your product supply line is sporadic at best.
2. Trying to sell contemporary products to the nickel-pinching Atari market at below-competive prices, when you could just as easily grey-market PC products in Computer Shopper, takes guts.
3. Operating two stores while running a mail-order business, designing ads, maintaining customer records, and handling dozens of personal requests a week with a small staff is grueling.
4. Dave Troy, the proprietor, writes very educational articles on the ST products and hardware internals, and publishes them in Current Notes. It takes considerable effort to write those articles.
5. Toad subsidizes new development for the ST. Look at the only competitive Fax software for the ST: Straight Fax. Toad got behind this product and put it on the market for us.
6. Last year, when the WAACE AtariFest wasn't going to be held, Toad found out and offered to put the show together for WAACE. When WAACE dragged its heels, Toad put together a show anyway, and held it at their store in Maryland.
7. Were it not for the show mentioned above, many of us wouldn't have seen the Jaguar being demonstrated. Toad gave one away during the show.
8. Toad sold me a Falcon030, and included free PD/Shareware, along with some European magazines (w/cover disk) that I can't buy anwhere else these days.
9. I've bought around $3K worth of merchandise from Toad. There have been some problems. Ocassionally I've had to call two or three times to straighten it out, but they have not failed to satisfy, once the requirements were made clear. And yes, they did give prompt refunds!
10. Dave and Jennifer both manage to get it ALL done, while going to college full time! Whatever they use for fuel, I want a supply!

Toad is about the best we can hope for on the east coast, when it comes to Atari. Before you trash them, find a better alternative. If not, work with them, cajole them, try to educate them. But don't make them get out of the market, for cripes sakes!

Full screen mpeg is slow on all machines not having a mpeg device.

>Mpeg is a 24 bit format , apparently some guy called 'Mr Brown' reckoned
>HAM8 was faster for updating (laugh) -> so if its so fast why is it that

It is both displaying (So not changing the image you display live) and
its faster encoding (jpeg encoding is way more work than ham8 encoding
both are useless live without megahardware).

>MPEG plays faster on a Falcon. Come on I want an answer, after all I thought

Its not i have't seem a falcon running a mpeg stream at 640*480 at 1/50 a
sec. Depending on the delta a 4000/40 will pull this of simply because
the ham8/anim calc. are very ease.

>HAM8 was mean't to be good for animations and lets face it, MPEG sorts the
>men from the boys. Also how fast does an 040 Amiga display a 640*480 Jpeg
>in Ham 8, My falcon displays it in 3-5 seconds in 65536 colours.

Jpeg is not ham8, so your question is stupid you ask the falcon to ONLY
display a jpeg and the amiga to convert from jpeg<>ham8 and then display.
its a bit more fair to convert them in ham8 and then display. this way
a 4000/40 can (i used scala) display about 2 pictures a sec (that seperate
pictures NOT a anim). A anim will run much faster fast enough to play
direct to a recording device. (I just talked to someone using 3dstudio
he wanted to know how to convert the fli files to the anim8 format because
he could display them live on the 4000/40 at work).

>:>>I mean, my MPEG player that I ported from X-Windows and am slowly adapting
>:>>to the DSP gets about 3-4 fps in 65536 colours! and this is on the so called
>:>>crippled Falcon. Brainstorm have it at 12-13FPS.

so 12-13 is nice (and shows you can program) but it still useless to run anims on if you want to use them for promo's or telly.

Sure its slower BUT you must use the best format on a platform and thats anim7/anim8 ham8 anims and they go WAY faster and in some cases look better then jpeg/mpeg anyway.

"I don't think so" - Homey D Clown.

I'd vote for the Amiga3000 crowd, making their own X-servers, Linux-680x0
and NetBSD-680x0. Markus Wilde, Hamish McDonald and the rest of the guys
have done a lot of 680x0 work. Most Amiga developers own A3000's have put
out tonnes of software, GNU ports, GCC, unix ports, etc.

It'll be interesting to see how many of the GCC 680x0 team are Amiga
owners and who are Falcon owners.

:>:>>Mpeg is a 24 bit format
:>:>Yep, a 24 bit chunky format...

Actually MPEG is not stictly a '24bit' format, the data is NOT stored as RGB
at all but CMY colour space -> this format has to be converted to 24bit colour.
(BTW what MPEG players have u written? I can show u mine).

:>:>>, apparently some guy called 'Mr Brown' reckoned
:>:>>HAM8 was faster for updating (laugh) -> so if its so fast why is it that
:>:>>MPEG plays faster on a Falcon.
:>MPEG will play faster on a falcon then a non AAA/EGS amiga, but the same anim

:>more colors.

My point was that Mr Brown reckoned that updating a HAM8 screen was faster
than updating a 16bit colour screen. Yes using some Kludged HAM8 format u
may be able to get a decent frame rate, but wheres the equivalent of MPEG for
HAM8?? Where talking real world stuff here boys.

:>:>Bacause MPEG is a chunky format and therefore fast on machines with a chunky
:>:>graphics modes(Falcon/PC). Amiga's with AGA chipset don't have chunky modes
:>:>and due to this they have big problems displaying MPEG movies fast.
:>But AAA and EGS amiga do have chunky modes.

Yes I'm sure a AAA amiga could play MPEGs well, I'll won't take back my comment
on 'any' Amiga (w/o additional h/ware) being able to play MPEG movies faster
than a Falcon because the DSP can do this at 12-13FPS for a 320*200 movie
and MPEG is IDCT intensive and DSPs are amazing at this sort of thing.
-> maybe an 040 AAA Amiga could match this?

:>:>Faster than an _Amiga_ CD32 with a FMV card also? =) Well, you said _any_
:>:>Amiga.

How much does the FMV card for CD32 cost?

>The CD32 plays at 30fps, but could play faster, it is held back to 30 for

>has a custom graphics mode. More colors then ham8.
>/ o Thomas Bonge Amiga 2000 G-force 40MHz 030 / MACIIfx -=> EMPLANT o \

Quite amusing really, I saw it playing a Star Trek episode in a shop and to
my eye the frame rate was too slow, there seemed to be a horrible blur in
fast camera sweeps...
I'd imagine the Jag could play MPEG movies very fast w/o additional h/ware since
its 50++mips and has very high bandwidth.

It's probably easier to do page flipping on the Amiga, update the
images on a separate screen and flip it to the front.

It's a hardware setup. If it's bad, blame C-cubed. I was under the
impression that c-cubed made MPEG decoders and encoders for multiple
platforms.

It'll be interesting if the Jag MPEG interpolates or somehow magically
outputs better than the original input. Once the CD has been encoded,
you're not going to play back much better, unless C-cubed had truly
stuffed up their decoding hardware and routines.

I'd like to see the Jag without any additional hardware play back MPEG
movies from ROM.

: } : Hang on Jim, the point is that the os *is* unix. The point of having
: } : unix ports on a unix os is quite important.
: }
: } So all those ST apps automagically know about the unix os?

: yes, it replaces the TOS calls with its own, and adds the unix ones.
: Most TOS calls are actually simple translations into the unix ones.
: (ie: you write CConws and the compiler uses fprintf(/dev/console))
: bad example, but you get the idea.

What happens when you don't want to run MTOS. I assume that you don't distribute normal TOS programs with MTOS install shell and script?

: } So if you distribute your software do you just assume that the person
: } alread has tsch, or korn or bourne shell?

: The MDK (MiNT Distribution Kit) is a set of programs that'll set
: your STfm ->TT up as a unix box. It contains the vast majority of
: programs you'll find on a unix box, mainly GNU stuff +others. It
: obviously comes with /bin/sh (therefore it copies that into /bin
: and then runs a script with "#!/bin/sh" as the first line.)

Okay, so you assume that the person is running MTOS, as you're running MTOS to be able to run the program. Then copy your shell into their bin directory and run them.

: In point of fact, I think installation progs can be made much nicer
: if they're gooey anyway. I'm re-writing (very slowly - I haven't much
: time) this in C++/Gem++.

Is there an X-Windows like interface, or is everything back at the command line shell? AmigaDOS has a GUI installer program that's available to all developers. It's quite a nice install program, better than the installer that Microsoft use for MS-Windows.

Or are all the TOS API calls translated into MTOS API calls?

497. Falcon 32 bit!

Newsgroup: comp.sys.atari.advocacy
Date: 1994-02-12 16:49:00 UTC
From: rickard.troedsson@troed.ct.se
Message-ID: <2d5d08a0@troed.ct.se>
Source record: 18898

Just to add to the 030sx lies ...

The Falcon uses burstmode, which only works if the bus is 32 bit.

At boot, the TOS puts the 030 into burstmode (both instruction and data), we've tried clearing it, and it became noticeable slower!

This, according to the Motorol 68030 manual, proves that the Falcon uses a 32bit bus.

How? There are only 16 lines on the board?

Multiplexing, the bus runs at 32Mhz 16bit, which the Combel (and a logic chip) buffers down to 32bit 16Mhz ...

We (I and Mats Loman) tried this a few minutes ago, and I can not see how this should be possible if the Falcon used a 16bit bus. (i.e, the Falcon should crash if you used burstmode on a 16bit bus, but TOS itself puts the Falcon into burstmode as one of the first things a boot-up!)

Griff, you said the Falcon was 16bit, since I know you actually SHOULD know, I'd like to hear what tests you have done to prove that point!?

(Do you have a very early developers Falcon? If so, it might actually BE 16bit!)

Take it for what it's worth, we've tried it.

Griff, Mats is very interested in chatting with you about ways to move data fast with the Blitter etc, could you please mail him at mats_loman@troed.ct.se ? (Xenit/Aggression mailed you through my BBS a few days ago but you never answered!?)

I have a portfolio with a card drive hooked up to my 386 clone with running dos 6.2. In the past it has function all right recognizing the card drive as drive d but when I just tried it it has no allocation. Tried running the cfx.com software but just get a "card drive not found" any ideas anyone??? I no this thing is really dated but!!

Thanxs Steven

I think there is a product somewhere that does this using the LAN
port, which I believe is what you meant - but you could always run
SLIP over the serial port if you wanted a cheap way to network with
another PC, or use the midi port for networking twix ST's.

>
>Has the digital joystick ports been removed? I know you can plug an

All ST machines since the STE (including the Falcon) ahve the regular
joystick ports, plus two Jaguar type joypad inputs - and at least four
Falcon games are coming out soon that use the Jaguar controller
exclusivley. The developer docs even say that Falcon games should
only use the Jaguar joypads...

I guess you must not program, or even run others peoples programs.
What do you do?

With memory protection, I can run stuff, and those pesky pointer
errors do not mean a reboot.

With memory protection, I can run some dodgy bit of shareware and have
it die without taking my whole system with it.

I may not be absolutley nesicary... just as wearing a saftey goggles
is not nesscary. But it sure is useful!

Like a lot of the device stuff - screen, keyboard, SCSI driver and so
on. Those compilers can take assembly commands anyway, so there might
be some assembly in there you don't know about. I also do not think
there is great interest from Atari or Amiga people for variuos reasons
anyway, so Linux will probably take a good long time to fully work on
either system.

>

Most of those Falcons came with MTOS - like most of the future systems
will. Pretty much the only people they are "Selling" mtos to are the
older ST users.

>Atari doesn't even seem to have their own production lines, so how are
>they going to build anything cheaper than IBM? What great features
>are going to distinguish the Atari product from IBM or Apple?
>

The software, and the user base, plus stuff like the onboard DSP. The
same question could be applied to the Amiga, what is the answer there?
I think the Power PC machines will cause quite a stir in the market,
and things may be messy for some time.

> A DSP that's not integrated into the operating system (which
> IBM and Apple, plus a whole heap of developers, like Lotus,
> Borland are working on in the PC groups)?
>

But the Falcon has it now - and there are OS calls to send stuff to
the DSP. What exactly do you mean "supported by the OS?" A developer
for any DSP is still going to have to write code for that DSP...

> A not-so-great video system (Falcon)? Even if they munged
> the Jag chipset into the Atari-PPC, they're not capable of
> displaying PC or workstation style 1280x1024x8bpp, 16bpp and

> of.

They come pretty close right now... and you can get video cards for
the Falcon and TT to get those specs if you wish.

>
> A LAN port that's not supported in the operating system?

This would be nice, but is not really nessicary for home users.

> Non-standard connectors?

You forgot about the standard Joystick, SCSI II, serial, parrallel,
audio in/out, DSP, power (:-)), Lan, composite video, and MIDI ports.
To which non-standard port were you referring?

> Atari ST cartridge slot?

Oh, that one. There are no standards for cartridge slots.

>

> Perhaps they'll cost reduce and use a 16bit data bus? Or

Warranty is one year on the Falcon, which I think is pretty decent.

>Think about how long it will take Atari to design and implement a new
>system and operating system with their current resources. Times a
>ticking, and their's going to be lots of PowerPC systems on the market
>soon.
>

Yep, and if they get cheap enough I may buy one of them. It will look
rather nice sitting next to my Falcon...

It is true enough that the design time is the real problem - but how
soon do you think viable (cheap to me) PowerPC machines will be out?
The first even slightly low end one will be a Mac model. But do I
want to buy that one? Even Mac people are saying it will be pretty
expensive, and will it be able to run the OS's I'd wat to really use
(like OS/2). I'd say about two years before we start to see
affordable good PowerPC machines (in the same sense that a 486 is
affordable now, $2500).

It most certainly is not a fact. At the time TOS was being ported to the Atari,
Atari had the choice of placing GEM on top of CP/M 68K, or GEMDOS, DRI's
MS-DOS-derived disk operating system. They chose GEMDOS.

:>its a bit more fair to convert them in ham8 and then display. this way
:>a 4000/40 can (i used scala) display about 2 pictures a sec (that seperate
:>pictures NOT a anim). A anim will run much faster fast enough to play
:>direct to a recording device. (I just talked to someone using 3dstudio
:>he wanted to know how to convert the fli files to the anim8 format because
:>he could display them live on the 4000/40 at work).

Yes I could convert JPEGs to a format more suitable to true colour and display them as fast as a hard-drive can read them, however the argument was about whether HAM8 was quicker for updating - the whole point of JPEG/MPEG is the compression ratio, not how fast it is to display each frame.

BTW I can play FLI files in true colour (with no conversion) at 50 frames per second on my Falcon, yes I can see how a format optimised for HAM8 could be made quite fast, however it is so non-standard and awkward for real-world formats like jpeg and mpeg that justifies the claim that it is a cheap solution and that True colour is less of a kludge and more useful.

:>>:>>I mean, my MPEG player that I ported from X-Windows and am slowly adapting
:>>:>>to the DSP gets about 3-4 fps in 65536 colours! and this is on the so called
:>>:>>crippled Falcon. Brainstorm have it at 12-13FPS.
:>Sure its slower BUT you must use the best format on a platform and thats
:>anim7/anim8 ham8 anims and they go WAY faster and in some cases look
:>better then jpeg/mpeg anyway.

Whats better about anim7/anim8? the fact that it uses 5 times more diskspace? the whole reason why mpeg and jpeg are so slow is because of the compression ratio they acheive, I can do the same compromise on my Falcon and have the anims running at 50FPS ...(and waste lots of disk-space)!

:>How? There are only 16 lines on the board?
>Multiplexing, the bus runs at 32Mhz 16bit, which the Combel (and a logic chip)
>buffers down to 32bit 16Mhz ...

No... I tried putting the Falcon into burst mode, and saw no performance
increase... I also tested 32bit against 16bit access and 32bit access was
exactly 2 times slower, proving that the Falcon has a 16 bit bus, however this
was only only using the bus on consequetive cycles, it seemed that if I placed
nops between the MOVE instructions that 32bit access was the same as 16bit
access. This would indicate some type of buffered read/write (multiplexed)
system, it would explain why the performance in general of the Falcon is much
better than that of a 16bit bus'd (pun) 030.

:>We (I and Mats Loman) tried this a few minutes ago, and I can not see how this
:>should be possible if the Falcon used a 16bit bus. (i.e, the Falcon should
:>crash if you used burstmode on a 16bit bus, but TOS itself puts the Falcon into
:>burstmode as one of the first things a boot-up!)

I'll check this out, I had a quick look at the ROM, and it just cleared the
caches... but I'll check it again.
It won't cause a crash, just have no effect.

ARGH!!! Why is the Jag only a 16 bit system? How do you define which
processor is to be used for the bus width? Let's put it this was: the 68000,
which can be used for generating screen maps (not graphics), doesn't need
a whole lot of speed.. It doesn't matter that it's only 16 bits.. The graphics
chips, which move mass quantities of data, have 64 bit paths... Why do you insist
that, because there is a 68000, that the whole system *has* to be 16 bit?

: same question could be applied to the Amiga, what is the answer there?
: I think the Power PC machines will cause quite a stir in the market,
: and things may be messy for some time.

The user base is tiny. How are you going to get people to want to
use MTOS? If those MIDI developers decide to port their applications
to PowerPC, it'll be probably more lucrative for them to port it to
Mac PowerPC, or some other more mainstream PowerPC operating system.

Why use an Atari DSP system when there are going to be lots of other
alternatives?

The only thing that will distinguish it is the operating system. How
many serious developers are going to write MTOS PowerPC applications,
when they could be developing Mac-PPC or IBM-PPC platforms?

So who's going to pay a big premium over the other power-pc platforms
for MTOS? If Atari unbundled MTOS, it would have go device independent
for it to succeed on other vendors's machines.

: > A DSP that's not integrated into the operating system (which

: They come pretty close right now... and you can get video cards for
: the Falcon and TT to get those specs if you wish.

Name one, the specs and price. Those 1280x1024x8bpp @ 74Hz cards cost
US$200. How long did Atari work on the Jag chipset and how much longer
would it take to expand the resolution, colour depth and refrest rates?
There are 64bit graphic cards appearing for the PC's right now, with
all the features outlined above.

: > A LAN port that's not supported in the operating system?

: This would be nice, but is not really nessicary for home users.

It will be for the PowerPC brigade. Paying for a LAN port that
you can't use is a waste of money. Hardware vendors are moving
to PCI connectors, so you can pick and choose SCSI II wide and
fast controllers (not plain-Jane SCSI-II).

: > Non-standard connectors?

: You forgot about the standard Joystick, SCSI II, serial, parrallel,
: audio in/out, DSP, power (:-)), Lan, composite video, and MIDI ports.
: To which non-standard port were you referring?

Mac's use the AT&T 32010 (something like that). They have graphic
programs that use the DSP to speed up operations. The PC's have
IBM's new MWave dsp system, which integrates fax, modem and voice-mail
into one. It can also play music and decompress JPEG's. Where's
the modem extension that Atari was harping on about?

Do you have a buffered FIFO serial port yet?

Atari can either try to cost reduce and place all those ports on the
motherboard, or using PCI cards instead. If they go for cards, it's
unlikely that Atari could produce them any cheaper or better than the
competition.

: > Atari ST cartridge slot?

: Oh, that one. There are no standards for cartridge slots.

How about PCMCIA?

: > Perhaps they'll cost reduce and use a 16bit data bus? Or
: > offer inferior service and warranty than their competitors?

: Warranty is one year on the Falcon, which I think is pretty decent.

Two years on some PC's nowadays. In home warranties on a lot of
name-brand PC's. Five years on a lot of components, like hard-drives,

video cards and keyboards. Two years on monitors.

: >Think about how long it will take Atari to design and implement a new
: >system and operating system with their current resources. Times a
: >ticking, and their's going to be lots of PowerPC systems on the market

: (like OS/2). I'd say about two years before we start to see
: affordable good PowerPC machines (in the same sense that a 486 is
: affordable now, $2500).

The Mac folks will be able to pop in a PowerPC card and get an big
boost in performance. The Atari folks will still be waiting for
third party 68040 hacks.

If you wanted cheap zings for the dollar, a MIPS R4xxx chip would be
much better value. The SGI Extreme^2 has about ten of those chips
in it.

Amiga aren't going to be doing much better. If they don't the AAA
chipset out the door, with a new PCI based system, they're going to
be dead.

Atari don't seem to have the cash to pay IBM to produce large
quantities of the Jaguar for a national roll-out. A lot of
countries don't expect to see any Jags till June 94 or early 95.
If they're selling them at near cost and hoping to get money on
software licences, they need lots of machines in the field, with
consumers buying software before Atari start raking in the dollars.
Making a couple of dollars on each cartridge (say $4) sold probably
hasn't helped their bottom line, say 5 games x 20,000 sales = 100,000
units. $400,000 profit is nothing on the sums involved to generate
this cash flow.

- Jim

Yes, this is the main reason why I find it hard to accept the "16-bit bus theory", tests indicate that atleast SOMETHING has been done to it to increase the performance.

(I also find it hard to believe the technicians would really allow a 32bit computer have a cpu with 16bit access, the only technician who has spoken on the issue (can look up his name if you want to) said "it's more like 24bit" ...

Uh, huh. Yep, it only works if you have a full 32-bit bus and static
column/page mode RAM.

>At boot, the TOS puts the 030 into burstmode (both instruction and data),
>we've tried clearing it, and it became noticeable slower!

Are you sure you didn't clear the cache enable bits ?

>How? There are only 16 lines on the board?

>Multiplexing, the bus runs at 32Mhz 16bit, which the Combel (and a logic chip)
>buffers down to 32bit 16Mhz ...

Sorry, Rickard, but I doubt this very much. This requires more complicated
logic than just putting 32 data lines to memory in the first place.

>We (I and Mats Loman) tried this a few minutes ago, and I can not see how this
>should be possible if the Falcon used a 16bit bus. (i.e, the Falcon should
>crash if you used burstmode on a 16bit bus, but TOS itself puts the Falcon
>into burstmode as one of the first things a boot-up!)

The processor does not crash if you enable burst on a system that does not
support it. The processor will just fill the caches the normal way.

I am running the Helios UNIX operating system and X-windows.

>Can you give an overview of it's strenghts and weaknesses, as they were mean to be
>the next big thing in computing.
The weakness is that the machine is to old to compeate with todays computers, but
back then it was a good computer. The biggest weakness is the Mega ST board that
is acting as the host for the transputer part.

>What software could you compile or buy off the shelf?
I could compile all UNIX/X-windows sources (if i have the source) and there
is lots of programs that can be bought for Helios, but its mainly different Compilers
and development tools.

Yep, its just like the jagCD isn't it ;-) , but you are right the cd32 units will in most cases don't have fastmem. But there will be addons for the a1200 and a4000 and the cd32. as a game's source it will be chip almost all the way as a tool im sure we will see apps using fastmem if there.

Daniel.

100% correct its a shame we don't have it but thats about it, its not the
end of the world, infact we got some darn good debugging tools to make up

for this.

>I guess you must not program, or even run others peoples programs.
>What do you do?

I do ... on MANY platforms and all those system crash sometimes. sure
my ami hangs more than the unix but most of the time its because i try
todo stupid stuff like running 10 or more big programs on only a 14 mb
machine.

>With memory protection, I can run stuff, and those pesky pointer
>errors do not mean a reboot.

its nice for sure but its even better to get the programs clean since
it is and will be a error memory protection will not solve this one
bit.

>With memory protection, I can run some dodgy bit of shareware and have
>it die without taking my whole system with it.

we can do this without problems its only not 100% a pity but i rather have
10 programs i like without mp than 2 with.

>I may not be absolutley nesicary... just as wearing a saftey goggles
>is not nesscary. But it sure is useful!

hear hear, its usefull just like many other features that the os does
have.

---

its not magic and its standard on more machines than there are falcons
to run your mpeg on. mpeg is good for one reason only, space if that is
not a problem you are stupid to use it simple as that.

>:>>:>>I mean, my MPEG player that I ported from X-Windows and am slowly adapting

:>algorithm (The IDCT is 7 times faster on a DSP 56001!!!!).

Image FX EGS V1.5 loads a JPEG and decodes it directly to the EGS 28/24
display hardware as the Jpeg is loaded. (multitasking amiga stuff)
If loading off a floppy it is displayed the second the drive stops, If
loading off a fast harddrive it is displayed within a 2 seconds of loading
(for a normal sized Jpeg of course). If preview mode is off, the jpeg is
just held in ram and is not displayed, but as soon as it is loaded you
can manipilate it, so I assume it is decoded into 24bit data already.
Unless it is still decoding it in the background, but I dont think it
does that. This is on a 40MHz 030 with a 50MHz 68882 and using the
optimized FPU/030 Jpeg loader module of Image FX EGS.

:>Wow! even better, can u tell me the name of this mpeg player, the one I
:>have for the A1200 is pretty slow (2FPS in HAM8 even with FASTRAM).

'MP' by Michael Van Elst. On a A1200 I would imagine that 2 FPS is about
rignt for this Mpeg player, But the A1200 has to convert it to Ham8 first,
which makes it slower. The author says he gets frame rates of up to 10,
depending on the Mpeg encoder, on his A3000 at 25MHz. On my amiga with
40Mhz 030 and EGS I get at least 15, but I don't know how to
measure it so I cant say exactly. MP does not have to render each frame
into Ham on my computer since MP has a mode to pass the 24bit data to the
EGS libries and they can render them in which ever mode you want. 24bit
chunky is the fastest, because it does not have to render it at all.
MP can also save each frame as IFF24 which
can then be made into Amim7 format with Ham8 or Iff24 frames (way to big
though), and then they can be played back twice as fast. You should get
atleast 15 to 20 FPS if you convert the Mpeg to Ham8/Anim7 on your A1200.

Anim7/Anim8 anim file sizes depend on what display mode the frames are
rendered in. If they are rendered in Ham8 then they are much
larger then Mpeg. But If they are rendered in somthing like DCTV
then they are smaller, and are in NTSC color (about 6 mil colors)

Except for two things: JPEG display to less than 24-bit displays
are limited by color-reduction time, not the the IDCT, and the DSP56001
is limited by its narrow and slow host port to the 68030. So unless you
have a tiny JPEG and your DSP were able to directly access your video
system (somehow), it'd be useless.

Never heard so much rubbish in my life, the IDCT and Huffman decoding take
50++ % of the time to display a JPEG, Converting 24bit to 16bit colour is
trivial (just quantization), whereas the IDCT is extremely intensive, this is
why there is so much ongoing research into faster algorithms for it, are you
really saying that an 030 can do IDCTs faster than a 16++mips DSP56001 (laugh)
-> the DSP does it 7 times faster than a 16mhz 030. As for the host port being
slow (hysterical laughter)... 2meg a second is slow is it?, you would need
200++mips to reach a point where bandwidth was a problem with IDCT -> do have
ANY IDEA how complex IDCT is? obviously not since if you did you wouldn't right
such rubbish.

HAM8 is more standard than 24bit displays? more standard than 15/16bit colour displays ? I think not. I'm sorry but MPEG and JPEG are THE standard for still and moving images, thus I'm justified in saying that for real-world stuff HAM8 is shall we say... 'not very good'. If Mpeg is so bad, why is commodore using it for the CD32 FMV system? Why not use the DCTV anim8 format? ;-)

The whole point is that Mpeg and Jpeg get much higher compression ratios, the reason they require so much power is the complex transforms needed to display the data. With a less complex format such as anim7/8 it is inevitable that things will go faster, I can do the same on my Falcon with a custom format.

>>Whats better about anim7/anim8? the fact that it uses 5 times more diskspace?

What things are better about ham7/8 than Jpeg/Mpeg ? -> these formats are
very flexible, they are worked on by *lots* of people, far more 'in the know'
than either of us.

HAM8 is quicker to update, precisely because it uses less memory. It's slower to
CALCULATE however. There is a big difference.

|> >|> Yes the 1200 has a 24 bit palette, ask some amiga programmers what they would

|> this point -> I need a laugh!

And the A1200 can plot 32 pixels in 256 colour mode around 4 times as fast (using
the processor) as the Falcon can plot 32 pixels in 16 bit direct colour mode.
(Adjacent horizontal pixels that is.) Do you dispute this? Go on, reply. I need a
laugh!

|> NO MY FALCON DOES 1344*600 in 8bit colour, this is because it has more bandwidth - does
800*608 in 65536 colours , with each pixel being definable UNLIKE HAM8.

|> make the Amiga OS really h/ware independent ;-).

I believe you said that screens could be implemented easily by any system with an HBLANK interrupt. This is infact, incorrect. The screens system requires displaying a new area of memory, from the top of it's butmap, at a given scan line. I can name at least 5 systems with HBALNK interrupts that cannot do this.

:>sample be 'better', once it's been through some kind of math functions?
:>If you told someone in the pro-music industry, that the sample they
:>recorded at 17.423 Khz, (to get exact tone back) would play better if it
:>was played back at 50 KHz? He'd laugh! How are you supposed to play the
:>same data 3 times (2.86977 would be exact) times it's original sample
:>rate, and have it the same?

The facts are that modules sound much better on a Falcon than on an Amiga,
its rather like comparing a saisho (el cheapo) CD player to a top-of the
range Pioneer model- they both play the same CDs but which sounds better? ;-)

Interpolation helps smooth samples (with a side-effect of a slight removal
of high frequency sounds), and to my ear and everyone who has heard interpolated
sound , it is better.
Are you saying that old records that have been digitally reprocessed sound
worse (laugh).

>displays ? I think not. I'm sorry but MPEG and JPEG are THE standard for still
>and moving images, thus I'm justified in saying that for real-world stuff

sure change the facts, you stated anim7/anim8 is non standard and awkward for
real world use. This is BS its standard as hell on our machines and
converting from a array of pictures or any other anim form is a peace of
cake.

what real world stuff the stuff people do today is NOT mpeg, Ive seen
people use anim/avi/fli but in the video world mpeg is still only used
for playback or if hardware is added.

>HAM8 is shall we say... 'not very good'. If Mpeg is so bad, why is commodore
>using it for the CD32 FMV system? Why not use the DCTV anim8 format? ;-)

Mpeg is not bad, but you don't use it if you have room to spare. ofcource
if it is a problem (like having a whole prerecorded movie on cd. it is).

>>>:>>:>>I mean, my MPEG player that I ported from X-Windows and am slowly adapting

>the reason they require so much power is the complex transforms needed to
>display the data. With a less complex format such as anim7/8 it is inevitable
>that things will go faster, I can do the same on my Falcon with a custom
>format.

So thats my point isn't it ?, ham8 is a nice trade off that has a better
result/byte ratio than 8bits graphics and it doesn't need decoding (for
the ham8 part) since thats done in hardware. This way my '40 machine can
run a neat ham8 anim with only 15%-20% cpu use. ofcource it will
use more mem than mpeg but thats life (one day mpeg-chips for encoding
/decoding will be as cheap as the ham8 part of aga and your points
are VERY valid but that time is not here yet).

>What things are better about ham7/8 than Jpeg/Mpeg ? -> these formats are
>very flexible, they are worked on by *lots* of people, far more 'in the know'
>than either of us.

Sure they did/do a great job jpeg/mpeg is very good if you look at the
bytes/pixel but its not perfect so if you don't have to use it why spend
a dsp on it ?

>>Daniel.
>
>Griff
>--
>

Im sorry but i still don't see mpeg with no extra hardware the best
solution if you need to animate stuff. you want it if you _have to_
so when using a normal format will get you in to practical problems.
If you don't see my points than lets stop this or take it to email
i have no need to bash a programmer who seems to have fun at
what he is doing.

Daniel.

So do you admit now that a Falcon is better for real-time stuff like phong
/gouraud/tmapping etc (which was what we we were arguing about). As for
being quicker to update because it use more memory. *yawn*. I'll let the
Amiga coders laugh at you.

:>(Adjacent horizontal pixels that is.) Do you dispute this? Go on, reply. I need a
:>laugh!

You use the word 'plot' when really you mean 'copy' because if each pixel was
'plotted' as such then you would need to use all eight data registers and
set or clear each register 'bit'plane appropriately - far slower than true
colour plotting. If it is faster for plotting in 256 colour mode then where
are the real-time texture mapping and gouraud at 50FPS demos like on the
Falcon?

>|> NO MY FALCON DOES 1344*600 in 8bit colour, this is because it has more bandwidth - does
800*608 in 65536 colours , with each pixel being definable UNLIKE HAM8.

>Then your experience of Amiga graphics is sadly lacking.

I've seen good stuff for the Amiga on TV's, but I'm talking real montiors here,
you reckon the Amiga beat the Falcon on an SVGA or any Multisync - I think not.
The Falcon has more bandwidth for video, so it can display higher res modes -
its as simple as that, the video h/ware in the Falcon is truely excellent.

>|> When did u use it then? Answer my question does it use PC standard bitstream
>|> stuff? does it remotely compare to real WP like WORD II for windows -> I think

I see... this is your only SAD reply. You admit I was right about the DSP
begin as fast as the 68882 at FP arithmetic? Your a BAD LOSER!

>[sad egotistical ranting deleted]

I'm only egotistical towards you because you deserve it, I get loads of mail
(including from people at Cambridge) telling how much they like my posts.
You obviously hate being proven wrong so often (i.e. DSP be able to FP
as fast as an 882.)

>|> Tell me what can the Copper do that I can't do on a HBLANK interrupt. The

I can do exactly the same with a HBLANK, you just sync to the screen addr
counter, hence the reason why STs could do overscan even when it was mean't
to be impossible.

>|> Amiga acheives multiples screens by simple writing the screen address and

You can? hmmm.. the only ones I can think of are the Spectrum and CPC 464,
the PC,MAC and Atari Falcon/STE are all capable of changing the screen address
on the fly. This 'real world' enough for you. BTW I have programmed such things
on 3 of 4 computers mentioned above so I can post exactly how to do it on
each if you want me to embarass you furthur. As for the MAC I'm sure I could
knock up a quick demo.

>ANY IDEA how complex IDCT is? obviously not since if you did you wouldn't right
>such rubbish.

Sigh. I thought you were reasonable. How about this: go profile
a JPEG decoder translating to a ppm, and see where the speed losses go.
When I did it, 37 % of my time was spent in the quantization function, and
only 12 % was spent in the reverse DCT routine. This was done on the
Independent JPEG group's djpeg program on a 405x600 24-bit JPEG file (about
77k long) using the default options and quantizing to 8-bits (by the way,
if you're going to nitpick on the 8-bit conversion instead of the 16-bit
conversion, don't: the find_nearest_color routine takes a measley 3.4 %
and a 16-bit conversion would only cut about 1.7 % from that). Now let's
see your numbers.

Also, you might like to reread my post and see where I said IDCT's
were faster on an 030 than a DSP56001. Hmm, I guess you can't find it
can you? Where are you measuring the 2 MB's per second? From the SRAM
connected to the DSP56001? What if I had a 600K JPEG file to decode?
Let's suppose you were using the exception vector table to interface to
the CPU. Every call to the DSP from the CPU to do an IDCT (you really think
the Huffman code is going to fit in the Falcon's meager 32 Kword DSP memory?)
is going to require at least 4 DSP clock cyles on top of the 3 CPU cycles
to execute. And this is without any data transfer, which will eat another
8 DSP clock cyles, assuming your host CPU is ready. This is slow! Oh yeah,
know how Motorola gets the 16 MIPS figure? Let's see, the DSP has an input
clock speed of 32 MHz, and each instruction cycle is 2 clock cycles long,

so the fastest we can possibly go is 16 MIPS. Wow, impressive --- I bow to your almighty benchmark.

Yes, I have an idea how complicated IDCT is. In fact, I know exactly what an IDCT is, and it isn't that complicated, especially for the 56001 which was designed specifically to speed up IDCT-style calculations. As for IDCTs being the subject of current research, this is news to me. The basic fast algorithm has been known since the mid-60s and it is optimal, so don't go making up stuff just to support your claims.

I don't have that time to spend in this newsgroup, because i have heavy studies to
take care off!

I heard some roumours that you are going to buy a PC?

I'll quote a part of your previous post again (above):

:>>:>is limited by its narrow and slow host port to the 68030. So unless you
:>>:>have a tiny JPEG and your DSP were able to directly access your video
:>>:>system (somehow), it'd be useless.

so the DSP is useless for JPEGs? (laugh).

IDCT takes about 25-35% of the time involved in JPEG, huffman coding takes
about 20. Colour quantization takes about 30% for 256 colours using the
original JPEG 2 pass algorithm . Are you really saying that conversion to
256 colours is only slightly slower than conversion to 16bit colour - what
drugs are you on man? The conversion code for 16bit colour is about 10lines
of code - the conversion code for 256 cols is about 50k of source, and is

2 pass and pretty slow. With your figures 37% is spent in the quantization (reasonable for 8 bit conversion, and 12% in IDCT... where is the other 51% spent... huffman decoding? (laugh).
BTW when I placed a DSP IDCT routine in place of the 68030 one in my MPEG player it doubled the frame rate, what MPEG/JPEG players are u working on?

> Also, you might like to reread my post and see where I said IDCT's
>were faster on an 030 than a DSP56001. Hmm, I guess you can't find it
>can you? Where are you measuring the 2 MB's per second? From the SRAM
>connected to the DSP56001? What if I had a 600K JPEG file to decode?

No... if we were talking SRAM then the DSP can fetch 24bits 16,000,000 times per second, giving 48 mb/s. Actually the DSP can fetch double this from its memory on-chip with parallel X,Y moves.

The HOST port gives 2mb/s. I know because I use it daily, this is more than any DSP could feed with IDCTs.

>Let's suppose you were using the exception vector table to interface to
>the CPU. Every call to the DSP from the CPU to do an IDCT (you really think

>to execute. And this is without any data transfer, which will eat another
>8 DSP clock cyles, assuming your host CPU is ready. This is slow! Oh yeah,
>know how Motorola gets the 16 MIPS figure? Let's see, the DSP has an input
>clock speed of 32 MHz, and each instruction cycle is 2 clock cycles long,
>so the fastest we can possibly go is 16 MIPS. Wow, impressive --- I bow to
>your almighty benchmark.

16 MIPS peak yes... but about 30 MOPS on average because of the parallel architecure .

add a,b #>100,x0 ; 48 bit add a=a + b , x0= 100

As for the transfer, the overheard of transferring the 8x8 block for IDCT to be performed on, it is about 20%, the IDCT takes over a thousand cycles to do, a 68030 takes much much longer.

> Yes, I have an idea how complicated IDCT is. In fact, I know exactly
>what an IDCT is, and it isn't that complicated, especially for the 56001
>which was designed specifically to speed up IDCT-style calculations. As for
>IDCTs being the subject of current research, this is news to me. The basic

>making up stuff just to support your claims.

Utter rubbish, you dug your own grave with that claim. Proof.

I cut the JPEG/MPEG IDCT routine from the source code:

```
* This file contains the basic inverse-DCT transformation subroutine.
*
* This implementation is based on an algorithm described in
* C. Loeffler, A. Ligtenberg and G. Moschytz, "Practical Fast 1-D DCT
* Algorithms with 11 Multiplications", Proc. Int'l. Conf. on Acoustics,
```

```
* Speech, and Signal Processing 1989 (ICASSP '89), pp. 988-991.
* The primary algorithm described there uses 11 multiplies and 29 adds.
* We use their alternate method with 12 multiplies and 32 adds.
* The advantage of this method is that no data path contains more than one
* multiplication; this allows a very simple and accurate implementation in
* scaled fixed-point arithmetic, with a minimal number of shifts.
```

1989, and the source is from 1991.

Hmmm... 1960's huh? optimal algorithms? (laugh) .. the latest one I've seen was in an IEEE mag and does it about 7 multiplies and 40 adds or something. You obviously don't read IEEE or communications of the ACM.

I accept that the Falcon has a 16bit bus from CPU to the COMBEL. I've never disputed this point, The TT is EXACTLY twice as fast for fetching from ST RAM , there is no doubt that it is faster, but it is clocked at 32mhz so what do you expect? surely it should be nearer X 4 if it is 32mhz ++ 32bit bus ;-) ? I'm telling you that there is additional logic in COMBEL which means the Falcon is not quite as 'crippled' as Amiga people would like to think, It doesn't bother me anyway, the Falcon is faster enough for me, but then again I'm a DSP coder... I notice that many Amiga heads WANT the Falcon to be crap, you will notice in my Posts than I don't want the Amiga to be crap, I merely quote facts and stuff from my experience.

I think the psychologists out there will see my point.

Some of it is in the Huffman decoding, some of it in file reading,
and so on. It all adds up. Note that I said the find_nearest_color routine
takes only 3.4% of the time, which is the only place your 16-bit color would
affect. 3.4% includes all subroutines called as well. As you may know, 3.4
is a pretty small number relative to 100. Also, whether it's 50K of source
or 10 lines is irrelevent to the speed.

The fact that the DSP IDCT code helped your MPEG viewer doesn't
really bolster your argument either. As we've seen in your case, actively
working on an MPEG viewer doesn't really help your knowledge too much.
Let's make it simple, what's a cosine transform? Just straight off the
top of your head --- no need to burden yourself with the discretization
of it, or any textbooks. Or even simpler, why use a CT in JPEG and MPEG
schemes? Why not a Fourier transform or a sine transform?

>16 MIPS peak yes... but about 30 MOPS on average because of the parallel
>architecure .

>add a,b #>100,x0 ; 48 bit add a=a + b , x0= 100

Very good, I can move a constant into a register on every add.
Must make the chip feel good or something. Come on, the 56001 is capable
of doing better. How about:

macr -x0, x0, a x1,x:(r6)- y0,y:(r6)-

I can show you a similar routine on an i860 that does 60 MFLOPS
peak. How useful is it in general? Not very. You know what supercomputer
people call this? A guaranteed-not-to-exceed number.

>>IDCTs being the subject of current research, this is news to me. The basic
>>fast algorithm has been known since the mid-60s and it is optimal, so don't go

>Utter rubbish, you dug your own grave with that claim. Proof.

This is proof if you think they came up with 1-D algorithm by
themselves, which they did not. The butterfly algorithm for 1-D FFTs was
found in the 60's and is straightforward to apply to DCTs as well.
The JPEG source is an example of refinement. In case you didn't know,
people working on stuff like this may invent a slightly faster version
for their main research. People are not actively researching on finding
the 6-multiply, 50-add IDCT. Guess you must not know much about signal-
processing.

> Where the heck are you getting these numbers from?

I get my numbers from David Oldcorn, the author of a JPEG displayer for the
Falcon, I have the IDCT stuff and have written my own CMY -> RGB conversion
using the DSP for MPEG. Ok? where are u getting your info from?

:>>256 colours is only slightly slower than conversion to 16bit colour - what

Don't you find it kind of funny that my Falcon displays True colour JPEGs
in 3 seconds and takes 6 seconds in 256 colour mode. The colour quantization
is quite slow in the official JPEG source , because it uses a 2 pass method
which is VERY GOOD.
In this case you are quite wrong - quantization to 256 colours is much slow
than quantization to 5 bits R,G,B , you know it , I know it, the world knows
it -> perhaps you should patent your super-fast quantization algorithm and
make some money. As for 50% in the huffman coding and other bits, don't make
me laugh please, its at least half that , you know it.

:> The fact that the DSP IDCT code helped your MPEG viewer doesn't

I can post about 2 meg of source which uses parallel instructions 50% of time
- so its kind of useful. ok? you disagree that the DSP gives 24 MOPS on
average? Don't make me laugh.

you wrote :

:>macr -x0, x0, a x1,x:(r6)- y0,y:(r6)-

This is in fact wrong, it is a non-valid 56001 instruction.
since you are using 'r6' in two parallel moves, if you knew anything about
the DSP 56001 , you would realise that it is fund-amental that the register
set is in two halfs with r0-r3 able to address X memory and Y memory
able to address Y memory when doing parallel moves.
If your gonna quote stuff - at least quote correctly or risk make a fool
of yourself like in this case.

:>>>IDCTs being the subject of current research, this is news to me. The basic

Know I don't claim to be an expert on signal processing, my degree is Computer
Science, however you are wrong to think that there will not be better/faster
IDCTs routines developed. You would be stupid to think otherwise, it may
come about from other related research, if you say that 'refinement' isn't
research then what do you consider to be research? It is not often these
days that something new is 'invented' so to speak, most research has it
foundations on some other work or APPLICATIONS of research etc.

BTW What PHD are you doing ? I'm applying for Multimedia distributed systems .

ok?

:>Thats nice and proves my point on the mpeg part ;-), btw does this mean
:>fli will support >256 colors (i really have no idea, please tell me).

FLI files are upto 256 colours, I can play 256 colour ones at the same speed
in TRUE colour or 256 colour mode, (but the TRUE COLOUR files will be played
with a 15 palette) - only colour reduction will slow it down i.e. if you
you to play 256 colour anims in 16 colour mode. QUANTIZATION TAKES TIME.

:>>HAM8 is shall we say... 'not very good'. If Mpeg is so bad, why is commodore

:>>that things will go faster, I can do the same on my Falcon with a custom
:>>format.
:>So thats my point isn't it ?, ham8 is a nice trade off that has a better
:>result/byte ratio than 8bits graphics and it doesn't need decoding (for
:>the ham8 part) since thats done in hardware. This way my '40 machine can
:>run a neat ham8 anim with only 15%-20% cpu use. ofcource it will
:>use more mem than mpeg but thats life (one day mpeg-chips for encoding
:>/decoding will be as cheap as the ham8 part of aga and your points
:>are VERY valid but that time is not here yet).

But a Falcon can play Mpegs/display Jpegs faster in a reasonable (where
reasonable means 256++ colours) faster than Amiga 1200. Ok?
Yes HAM8 is a nice 'compression' scheme in itself, however it takes time
to manipulate this, hence for realtime stuff it is bad, and for anything
other than specially prepared formats - THIS IS NOT THE CASE WITH 16BIT COLOUR.

Some other guy was claiming that only 12% of MPEG/JPEG time was spent in
the IDCT routine, if this is the case then you should be able to play MPEGs
at 50 frames per second in less than 30% of an '040s time. (laugh).

:>>What things are better about ham7/8 than Jpeg/Mpeg ? -> these formats are
:>>very flexible, they are worked on by *lots* of people, far more 'in the know'
:>>than either of us.
:>Sure they did/do a great job jpeg/mpeg is very good if you look at the
:>bytes/pixel but its not perfect so if you don't have to use it why spend
:>a dsp on it ?

Well it is a standard ,certainly not state of the art compression - some
fractal based (patented to hell!) acheive 2 to 3 times better. You don't have
to spend a DSP on it, all Falcons come with one as standard ;-) .

>Im sorry but i still don't see mpeg with no extra hardware the best

>what he is doing.

My point was that in the real world, Falcon and Amiga quirky picture formats
are v. non-standard. Mpeg/Jpeg will be supported in 5-10 years, can we
say the same for HAM8 anim7/8? And a Falcon has the advantage that it can
display these images more quickly, thats not to say the Falcon will be about
it 5-10 years! (but things like this don't bother, I *enjoy* my Falcon it
thats all that matters, But I will not have people spreading mis-information
about it - call me the 'defender of the realm' if you like :-)).

549. WANTED: Info on BAREFOOT(Hybrid Arts) ATARI Support STATUS

Newsgroup: comp.sys.atari.advocacy
Date: 1994-02-14 21:01:29 UTC
From: rwn@cbnewsd.cb.att.com
Message-ID: <CL8Fqo.D0E@cbnewsd.cb.att.com>
Source record: 18850
Cross-posted to: comp.sys.atari.st,rec.music.makers.synth,comp.sys.atari.advocacy,comp.sys.atari.st.tech

I am looking for information on the current status of the BAREFOOT
SOFTWARE Company, who marketed Music Sequencing and Editing software
previously developed by HYBRID ARTS. The current phone numbers
for BAREFOOT are:

Voice: 818-727-7143
Midi BBS: 818-996-7659
FAX: 818-727-0632

For the past few years I have been using Stefan Daystrom's
"SMPTETRACK" professional music sequencing software with
SMPTE lock-up. I've finished moving and re-building my
studio and am looking to upgrade and add components to this
system. (Possibly upgrading my 1040 ST to a Falcon or ??, etc).

I have tried contacting the above three phone numbers and have received
"no answer", including no answering machine for the voice hotline.

What's the scoop ? Hopefully they have only suffered temporary
problems due to the recent earthquakes and will be back soon.

Any information would be appreciated.

Thanks,

Bob Neumann

And Amigas never run demos do they ? ;-) Demos were responsible for selling
a rather large percentage of the Amigas in the world today.

If your against demos then your against a major sub-culture on the Amiga,
yes demos are "useless", but life isn't all word processors and spreadsheets,

DON'T BE SO BORING.

Like it or not the aga chips are good for tv & simple use on both the old
serie of monitors as on the new ones. If you really want better get one
of the many cards for it which will get you what you paid for don't forget
that the TOTAL cost of aga set are around $35 making current a1200 over
here as low as $340. (i myself always use 3 screens of 720*560*16 colors,
one for all the shell/debugger stuff one the compiler stuff and one for the
wb).

you two don't make any sense BOTH the dsp and the 882 are VERY good for
what they where made for the dsp in the falcon is great but all these
great extra's resulted in a higher price and a lower machine count (ie it
wasn't a followup for most st owners).

>make the Amiga OS really h/ware independent ;-).

The advantage of a coprocessor (like the copper) is that you get to avoid
both the interrupt latency problem caused by higher prioriy interrupts
than HBLANK and you get to avoid the number of cycles it takes to get into
and out of an interrupt. (Because of processor state that needs to be
saved this is generally a non-trivial amount). The copper doesn't have
the latency problem, and doesn't have the state save problem, because its
a seperate processor. In a 2 bus system like the Amiga (chip ram and fast
ram) or when the main CPU has instruction/data cache) you can even avoid
contention between the main CPU and the copper in many cases.

I agree on the rest of the message but this one stinks (sorry) you stated
it could do it as fast as a 16mhz (maybe 20mhz) 882. He told you that all
the copro's for the a1200 run at 40mhz or 50mhz making the 882 faster.
This is not weird since its not the main reason for having a fixed dsp i
myself would rather have the dsp but this doesn't make your claim valid.

I for one will get the dsp module (66mhz att3210) as soon as the morons
at cbm set the standard for it, it would make a nice 'mate' for my '40.

Daniel.

He never quoted 40 or 50mhz until I had proved that the DSP was worth a 16/20 mhz 68882 - its kind of funny to see his argument when he quotes the spec for HIS machine as a 25mhz 68882. (digging his own grave). I'm glad you agree, the DSP is very versatile and not limited to sound like some Amiga advocates would have people believe.

its interesting to note that the 68882 does large integer stuff too. Its also interesting to note the DSP can outperform a 50mhz 68882 in this area.

>I for one will get the dsp module (66mhz att3210) as soon as the morons
>at cbm set the standard for it, it would make a nice 'mate' for my '40.

Yes the att3210 blows the 56001 away, I hope it becomes 'standard' on the Amiga range, because it is the DSP which makes the Falcon.

Again note the difference, I would LOVE to see att 66mhz DSP in Amiga's as standard, I would buy one just to program this beast of a chip.
A lot of small-minded Amiga people want the Falcon to die - how sad and pathetic they are, this is the difference between me and them.

: , there is no doubt that it is faster, but it is clocked at 32mhz so what do
: you expect? surely it should be nearer X 4 if it is 32mhz ++ 32bit bus ;-) ?
: I'm telling you that there is additional logic in COMBEL which means
: the Falcon is not quite as 'crippled' as Amiga people would like to
: think, It doesn't bother me anyway, the Falcon is faster enough for me,
: but then again I'm a DSP coder... I notice that many Amiga heads WANT the
: Falcon to be crap, you will notice in my Posts than I don't want the Amiga
: to be crap, I merely quote facts and stuff from my experience.

: I think the psychologists out there will see my point.

If you guys were half-way interested in knowing the truth about whether
the falcon has a 16bit or 32bit data bus, whether it can do burst mode
transfers to a 16/32bit DRAM memory, you should ask in the comp.sys.m68k
newsgroup. You would most likely get a reply from a Motorola engineer,
who helps build systems from scratch and knows enough about the
processors to debunk all these "facts".

All these half-baked, cache bound tests are just bunk. Same goes with
these test cpu-ram tests in the TT. If the ram is clocked at 32mhz,
how on earth is a 16mhz cpu going to access it at 32mhz, which the x4
theorectical claims it should be?

Or how about go to comp.benchmarks and dig a good pd c source for a
good cpu->ram test? Compile it under gcc on a 16mhz and 25mhz A3000,
a 16mhz Falcon and the 16mhz Atari TT, and come back with the source.
It'll be interesting to see how Andre Yew's pet compiler stacks up.
My money's on AY's

>then Atari is a piece of shit and is lying to confuse the market.
>Otherwise, their claim is valid.

Thanks for contributing with some sane comments, but I disagree with you about the last part. I believe that the 64-bit bus of the Jaguar removes a very important bottleneck since it allows for a doubled information flow (compared to a 32-bit system running at the same frequency). I'm sure you're already aware of this. But I also think that presenting the number of bits this way is a good measure of the capacity of any video game.

64 bits in the Jaguar indicates that the bus has a big bandwidth, which allows for graphics and sound with better definition than the NES, Genesis/Megadrive, SNES, CD32, and other systems which are labelled 8-bit, 16-bit, or 32-bit.

Do you think that 64-bit registers in the computing parts of the different Jaguar chips would improve the system significantly?

Hey! YOU WERE ASKING WHEN THE 020 ***CPU** IN AN A1200 OUTPERFORMED
THE 030 ***CPU*** IN THE FALCON

and I told you.

Trying to change the subject is your usual tactic when someone gives
you a straight answer.
There wasnt anything in the post about drawing to the screen, just a
challenge to say that the 020 in the 030 can outperform the 030 in the
Falcon . I asserted it could because of the poor design of the Falcons CPU
to memory interface (ie 16 bit datapath).

Please feel free to point out that with a high rez video mode, that
the Falcons CPU will outperform an A1200 with FastRAM for executing
programs....

by the way, when the CPU draws to the screen, how many bits can it put
with one cycle - 16? The A1200 can put twice the amount of data in one
write couretesy of the FULL 32 BIT MEMORY ACCESS.

I doubt that you can, but I expect you will simply try changing the
subject and or insulting me.

Gavan

Whats this Griff? You can only say that there is `about` 70% contention
in this mode on the A1200 and `about` 40% in 320x200x256?

Well, I`m afraid `about` isnt good enough for me, you lack the
technical knowlege and have no grounding for your arguements.

>>in a
>>high video mode? OK? comprende?

`The Amiga will suffer more contention than the Falcon`, well
considering that the processor SUFFERS NO CONTENTION AT ALL when accessing
fastRAM down a FULL 32 BIT PATH I think that yet again you have showed
your ignorance. You seem to think you are an expert, but your posts reveal
you to be less than knowledgable.

You see, Griff, a computer spends a lot of its time processing, and to
do this it has to access memory. There may of may not be more contention
on the A1200, but it simply doesnt matter since any executable code will
be running from fastram which offers zero wait state 32 bit access, as
opposed to the Falcon where executing programs must share RAM access with
the gfx chips - what an inneficient system!

Writing to the screen may or may not be slower, but since the A1200
can put 32 bits to screen memory at a time from its CPU, and the Falcon
can only manage 16, I think that you will find the A1200 is in fact faster.

You`re such an expert, tell me how many bits per second the CPU can
write to the screen in 640x480x256 NI on both the Falcon and A1200 (since
you seem to have access to them both) and then tells me what happens to
the speed of your programs when you run them in this mode (as opposed to
640x256x4, say) on the two machines.

>> >i'd hate to see the figures with the blitter and copper going...

>up for the lack of a copper, besides which the '030 can do everything >that
>the Copper can do. Copper use is also not free - it adds to contention.

It seems to me that the Falcon is more designed like a games machine.
(a pity theres such little games software for it!)
After all, giving your Gfx chips a 32 bit path whilst forcing your CPU to share with them down a 16 bit path isnt exactly good computer design, is it? I wonder if the Falcon is what Atari did with their design for the Panther games console.

The A1200 is much more suited to computing uses .. it allows the CPU (thats the part that does the COMPUTING Griff) full 32 bit access and it has two seperate 32-bit busses (64 bit machine anyone?) which allow the CPU full access to memory whilst the gfx chips have their own Chip memory (which is also CPU accessible)

>anything about the base Amiga config? Nope. All you are doing is
>attacking me becuase you cannot face the truth.

What is the mis-information? The base machine is the lowest
configuration a machine is sold at, and in the case of the Falcon this is
1 Meg , no HD. The base model of the A1200 is 2 meg, no HD. What basis do
you have for saying that the base model is for expansion only. Do you have
to sign a form when you buy it promising Atari that you will add some RAM
and a HD? I was merely pointing out that its as valid to say that the base
A1200 has FastRAM, as it is to claim that all Falcons will have 4 megs and
a HD.

I wasnt referring to you specifically, but the its a fact that many
Falcon owners complain that the base A1200 doesnt have fastRAM when I
could claim that the Falcon has only 1 meg of RAM by the same argument.

>>
>> The fact is that you can buy both machines in a mimimal config. In
the
>>case of the F030 you can buy one with only 1 meg RAM and no HD for

to
>>achieve anything like the potential they can deliver.
>>

>No, it is not - anyone who wants to buy a Falcon will get the 4/80
>model. The 1MB version is just there for the guy who like to put a
>system together seperatley...

Right, so ALL Falcons out there have 4 megs RAM and a HD. As I pointed
out, it would be very difficult to beat the price of a 4 meg+HD Falcon
seperately. I think its there to provide the cheapest possible path for ST
owners to get a Falcon. You have absolutely no basis for you assertion
that it only for expansion. 1 Meg , no HD is the base as it is the lowest
spec model that you can buy, period.

>> So please Falcon owners, if you insist on comparing base configs and
>>point out that your Falcon is faster than an A1200 with no FastRAM, then

>Only Amiga would be that stupid... and even they have some backwards
>compatibility, right?

It is perfectly possible to write code that runs on a 68000 and not on
an 030. There was plently of Amiga games and demos that didnt like 020
processors, even when you switched off the caches.

You say the Falcon blitter is compatible with the STe blitter? I hope
they added barrel shift capability then as this was a drawback with
previous Atari blitters.

Gavan,
You are making the assumption that every Amiga 1200 has Fast-Ram.
Most probably do have Fast-Ram, but a rather large percentage probably
do not.

You can add 32 bit memory to a Falcon, via an aftermarket product. Of
course that product cost 3 times as much as Amiga's Fast-Ram but it also
comes with a 32Mhz processor.

<Sigh> The 68030 is on a 16bit bus, the other chips get full 32bit access.
'Oh, I know so much more than Griff because I have an Amiga' Mm right.

|> Gavan.
|> Educating Griff on the basics of computer hardware.
I think Griff knows about computer hardware - at least on the Falcon. You
apparantly do not understand the Falcon beyond the usual 'It's not an Amiga so
it must be crap' level.

As an aside, a friend bought a 1200 the other day. For the price it was good
value with loads of extra software including GFA basic 3.x, Photon paint,
Dpaint IV and a bunch of recent games, all for 349GBP. The games all looked
nice. The desktop was very configurable but still looked bloody aweful to me.
A case of what you are used to I guess. I paid over 2.5 times that price for a
Falcon with HD but no software. Don't ask me why, but having played with an
Amiga for a bit, I'm still damned glad I stuck with Atari. It just feels so
much better in use.

:>share with them down a 16 bit path isnt exactly good computer design, is
:>it? I wonder if the Falcon is what Atari did with their design for the
:>Panther games console.

The 1200 is far more games orientated than the Falcon, hence the h/ware
sprites and copper , which are primarly used for games. I would happily
admit that a 1200 is better for platform games. Gosh what at accolade!
better at 3d games , *no way*, Falcon is at least 3 times better for this
simply because of the DSP.

:> The A1200 is much more suited to computing uses .. it allows the CPU
:>(thats the part that does the COMPUTING Griff) full 32 bit access and it
:>has two seperate 32-bit busses (64 bit machine anyone?) which allow the
:>CPU full access to memory whilst the gfx chips have their own Chip memory
:>(which is also CPU accessible)

Falcon has MIDI/SCSI 2/LAN/IDE/ 16bit stereo sampler etc etc etc, sounds a lot
more useful as standard to me. The Falcon is in a different league, the 1200
is cheap and good value, the Falcon offers a lot as standard.

your rantings make me laugh, you have such weak arguments. FASTRAM FASTRAM
FASTRAM... this is your only answer - do we want to compare Falcon with
FASTRAM to 1200 to FASTRAM? come on I dare you.

>Gavan.
>Educating Griff on the basics of computer hardware.

yawn.

No... you implied that there was one 16bit datapath, which is clearly wrong,
only the CPU has 16bit datapath. ok?

The Falcon's 030 outperforms the 1200's 020.
The Falcon's 030 with TTRAM outperforms the 1200's 020 with Fastram.

ok? that straight enough for you?

> There wasnt anything in the post about drawing to the screen, just a

Your ENTIRE argument is based on FASTRAM . *yawn*.

> by the way, when the CPU draws to the screen, how many bits can it put
>with one cycle - 16? The A1200 can put twice the amount of data in one
>write couretesy of the FULL 32 BIT MEMORY ACCESS.

full 32bit memory access with 3 times the amount of contention and 100%
saturation in high real world modes. Amiga people still live in the world
of crap resolutions like 640*480 or 700 *500... us Falcon owners use 800*600
or 1024*768 * 256 and still have 1.5mb/s bandwidth to the screen left. Yes
an A1200 with FASTRAM is nice, but it is not as clean-cut as some simple-minded
people would like to think, (no names mentioned).
(sorry couldn't resist that one.)

> I doubt that you can, but I expect you will simply try changing the
>subject and or insulting me.

I have far more respect from people than you, and enough people insult you
anyway, I wonder why that is?

Those are what we have come to expect though from the computers of today ...

I also was unaware that you could get a 1 meg Falcon in the UK as 1 meg
should of been dropped and most developers will not look at the 1 meg limit
as a problem but look to develop for 4 megs or even more .....
(but if you knew anything about a Falcon you would know this already !!!)

Rubbish, you claimed that the 32Mhz of the Falcon bus allowed the
Falcon CPU to operate effectively as a 16 Mhz/32 bit memory access 030.
Not that it was theoretically possible with a suitable memory controller.

You were confronted with a FACT (the 16 bit memory access) and true to
form you made up a story to back you up.

>..but ofcourse, what could one expect from a <person> like you ...

The usual insults that I expect from people like you who can`t string
together a coherent argement without making things up or insulting the
poster.

Rubbish, you were claiming it could do FP about 8 times as fast as an
882. You `proved` it could do it half as fast as an equivalent clock speed
882, so you were well and truly caught out. Of course, it doesnt stop you
from making stupid posts like that. Furthermore, you have to load the FP
program into DSP memory first and do a bit of setting up things up to do
the calculation, thus reducing the effectiveness.

>The Falcon is much more compatible than you would
>think, the reason most games fall down is because of the 030 and
>protection
>which on the ST was often particularly reliant of screen h/ware timing.

OK. But from initial reports there was an all-new gfx system. What was
certain was that before this `magic` and 1backwards` business there was a
massive incompatibility of programs. Many Amiga games which didnt run on
the 1200 fell down on the same points, but in general older Amiga games
were a LOT more compatible with the A1200 than ST games were with the
Falcon which seemed to indicate a very high level of incompatibility.

>No... in high resolution modes, say 1280*256 in 256 colours the
>CPU is just about locked out of writing to the screen, the Falcon is >not,
>the main reason why the Falcon suffers less contention is dues to its
>BUS design

Thats strange, I`ve decompressed JPEGs onto such a screen with the CPU
even running the program from fastRAM (Falcon style, well not quite, it
had 32 bit access) and there was enough processor time to provide
reasonable performance. With fastram of course, things run a lot faster
since on the A1200 the CPU can do all the processing with zero wait states
, unlike the Falcon where contention doesnt just affect video accesses,
the whole machine is slowed as programs have to execute from the contended
area.

Whats more , the contention on the Falcon is much more significant than the A1200 since the A1200 CPU can read/write TWICE as much in one access than the Falcon CPU can.

You said you had done tests, lets see you back that up by posting the figures for examination.

Im particularly interested to see how fast both systems can move memory in video ram at a screen rez of 640x480x256 NI. Also, what effect does this rez have on program execution speed on both systems (vs say a 640x256x4 screen). Clue: The speed on the A1200 will decrease only slightly depending on how much screen access it needs to do.

> You say Ricard and yourself educated him? how do you know what the

>really
>want me to. Never say that anything 'cannot be done', most things can >be
done
>but its the speed at which they can be done that counts.

Yes, please explain. I can see how it could do it if there were 65535 memory registers , but by ataris own definition of `True color` each pixel colour maps directly to the two bytes of info describing that pixel rather than a LUT. I`m prepared to totally apologise if you can prove that you can achieve two, completely independant 256 colour playfields by manipulating the two bits of the screen memory.

!!! What ?? Why ??
<seriously> I consider the OS to be MiNT or MultiTOS - whichever you have installed. MiNT is free, so anyone can get it. It's *very* nice to have the os as pd software for your computer :-)
The difference between MultiTOS and MiNT is that MultiTOS has a multi-tasking AES as well as the lower-level stuff in MiNT.

I boot up with MiNT all the time.

} : In point of fact, I think installation progs can be made much nicer
} : if they're gooey anyway. I'm re-writing (very slowly - I haven't much
} : time) this in C++/Gem++.
}
} Is there an X-Windows like interface, or is everything back at the
} command line shell? AmigaDOS has a GUI installer program that's
} available to all developers. It's quite a nice install program, better
} than the installer that Microsoft use for MS-Windows.

Hmm - not sure I understand. MiNT has all of the TOS calls, +others for things like threads,pipes,shared mem etc. etc. I run GEM just as I normally would, but the low-level stuff is now multi-tasking. MultiTOS makes the high-level stuff multitasking as well.

My installer lists subsets in one window, allows you to select the ones you want, then installs the subsets into the correct place with the correct permissions for owner/group/world etc. Basically they're just tar.gz files.

} Or are all the TOS API calls translated into MTOS API calls?

Yes, see above.

Simon.

I profiled the JPEG source myself. You guys must be doing something
strange for your numbers to come out that way. Get hold of the SAS/C 6.51
compiler and do it yourself if you don't believe me. BTW, Huffman decoding
does take quite a big chunk of time. What kind of quantization are you doing
for 16-bit color? A simple ordered dither?

I thought CMY(K) was used for printing, and that JPEG/MPEG used a
YBR color space (the CCIR 601 color space). MPEG books ... what will they
think of next?

>I can post about 2 meg of source which uses parallel instructions 50% of time

I never said this. All I said is that it is not an active
research area. It was a byproduct of some other research. Real
research is when some fundamental new algorithm is found, like the
original FFT algorithm.

> sound , it is better.
Where's the proof???
Well try this:
get somewhere a STE/TT/Falcon and the program PAULA (available at many ftp
sites) and play some modules (yes, it is a Paula-emulator). You can switch
between 12, 25 and 50kHz and switch on and off interpolation.
This is my impression I have:
noticeable improvement if interpolation is switched on, even at 50kHz.
noticeable improvement if frequency is higher, but the difference between
25kHz and 50kHz is very small, especially if interpolation is on.
Note that this is done on a 8bit 2channel system! 16bit adds some more
quality.
Why is interpolation improving the sound quality?
Because PAULA interpolates (= oversampling) the samples before adding them
together. This is done with some brute-force algo which requires a TT to run
at 50kHz.
Griff: do you interpolate the 4 voices separately before adding together?

Georges.

You talk about stuff you know nothing about, barrel shifting allows you to shift say 15 places in the same time as 4 places (etc), the STE blitter has always been able to do this, it certainly has the same shifting capability as the Amiga blitter. This is another example of mindless mis-information from someone who is really rather lacking in hard knowledge.
The Falcon blitter is 2.5 times faster than the STE blitter, the AGA blitter in the 1200 is 1.4 - 1.5 times faster (MAX). ok? I quote facts, you talk bollox.

:>than a LUT. I`m prepared to totally apologise if you can prove that you
:>can achieve two, completely independant 256 colour playfields by
:>manipulating the two bits of the screen memory.

Ok.. Gavan I'll educate you (again)

You have two screens each using 1 byte per pixel (8bits per pixel gavan).

ok... now you can view the True colour pixel as a 15 bit palette, so you
have a choice of 5 bits of R,G,B for each pixel.

You combine the two bytes to make 1 word ().

we now have a lookup table for this 'word' which has the the 'palette'
for the 65536 colours. (this is the what u wanted as above).
The 65536 colour are simply the two seperate playfields colours added together
for the 256*256 combinations. Thus we have a dual playfield. A 68030 could
do this about 17FPS with the following code:

```
; a0 -> playfield 1/2 (interleaved bytes FIELD1/FIELD2/FIELD 1 etc )
; a1 -> true colour screen
; a2 -> colour lookup.

move.w (a0)+,d0
move.w 0(a2,d0.w*2),(a1)+
```

you repeat this loop say 60 times and fit it nicely in the cache, so even
with the 030 you get 17FPS. the DSP code would run about 25FPS, it would run
much faster, but there is not enough DSP memory to store the lookup or both
screens so it would only go at about 25FPS.

I dunno if your intelligent enough to understand this method Gavan, but at
least some of the Amiga coders will. I hope you'll see what a nice mode
1 word per pixel is.

There is no need to do a simple ordered dither, you just take the 8 bits, R,
G,B and chop them down to 5 bits R,G,B - you can accumulate the error with
a little extra effort but its not really worth it IMO. This is why quant
ization to 256 colours takes so much longer because you need to use complex
dithers and best colour matching (etc) to get a goodlooking image.
All JPEG viewers on the Falcon use this simple quantization to display
jpegs in TRUE colour.

>very important bottleneck since it allows for a doubled information flow
>(compared to a 32-bit system running at the same frequency).

Not unless we can call a system with two 32bit buses, one to RAM and one
to where the framebuffer is (VRAM), a 64bit machine. Both designs serve
the same purpose.

If Atari can claim the Jaguar is 64bit based on it's 64bit bus which has
to also be used to get information from the framebuffer in main memory
up and down the bus, than so can Panasonic/3DO becuase it has two buses
with a total of 64data pins doing the same thing.

> 64 bits in the Jaguar indicates that the bus has a big bandwidth, which
>allows for graphics and sound with better definition than the NES,
>Genesis/Megadrive, SNES, CD32, and other systems which are labelled 8-bit,
>16-bit, or 32-bit.

The multibus architecture in the 3DO serves the same purpose.
Long live the first 64bit game machine on the market!!! The Panasonic 3DO! :)
Of course, since there are other data paths in addition to the buses mentioned
it is actually a 144bit or 176bit system!!! Damn those 3DO guys are
innovators.

> Do you think that 64-bit registers in the computing parts of the different
>Jaguar chips would improve the system significantly?

Yes. It would also make it a 64bit system. Shame it's not.

Griff ? Did you miss this part of the post ? I did not see any reply.
Gee, could it be that Andre actually knows more than you? Can't be.

Here's a clue: Andre knows what he's talking about. His posts are
consistently correct, and he does not make things up to make some machines
look better than other.

Another thing: I verified Andre's profiling results with a profiling C
compiler here. I trust these figures more than some hackers estimations.

What a silly comment. The Amiga shell is a lot more powerful than UNIX shels in quite a lot of ways, eg:

Command Templates (probably one of it's most powerful features.)

Regular expression pattern match for filename wildcards

Sensible command names

Global environment variables set from any shell, not just the initial one

etc.

|> is not nesscary. But it sure is useful!

Useful, yes, but at the expense of an efficient context switch. Maybe it would make sense to implement it on the HP-PA based Amigas when they are launched, but until then I'd rather keep my efficiency thanks.

Go ahead, make my day ;-) I've downloaded all those cica icons and thought most of them were ugly. Some were okay, lots of them were useless. Who needs 20+ Lotus 123 icons?

I'd be interested in seeing what colour scheme you use. I tried to make a custom one, mainly blues and greys, but gave up after having the other icons turn ugly ;-/

It might be what you think we're talking about. I was talking about updating
the screen. The Falcon probably is better for DSP type gamey effects.

|> being quicker to update because it use more memory. *yawn*. I'll let the
|> Amiga coders laugh at you.

Well kiddies, which of these takes longer?

1) Writing 2 16 bit pixels along a 16 bit bus at 16 MHz

or

2) Writing 4 8 bit pixels along a 32 bit bus at 14.3 MHz

Gosh that's a hard one :-)

|> You use the word 'plot' when really you mean 'copy' because if each pixel was
|> 'plotted' as such then you would need to use all eight data registers and
|> set or clear each register 'bit'plane appropriately - far slower than true
|> colour plotting.

If you write routines that draw areas on the screen pixel by pixel, I have some
bad news for you, you aren't doing it terribly efficiently. Chunky pixels are
better for texture mapping and such like, but I didn't buy my computer to use as
a Super Nintendo.

|> I've seen good stuff for the Amiga on TV's, but I'm talking real montiors here,
|> you reckon the Amiga beat the Falcon on an SVGA or any Multisync - I think not.

Yes, I personally own and use a .28 dot pitch multisync monitor. 800*600 HAM8 on
one of these has to be seen to be believed.

|> The Falcon has more bandwidth for video, so it can display higher res modes -
|> its as simple as that, the video h/ware in the Falcon is truely excellent.

Resoloution is only half the story. There is the question of colours too.
An A1200 can do 784*1100 in over a quarter of a million (ie a lot) of colours.
We're talking seriously photo-realistic here. If the video RAM in the Falcon is
80ns, as I believe it is, then I would dispute it has more bandwidth anyway. (I
have caused effects which I believe to be caused by RAM wait-states on AGA using
80ns RAM, so it would seem sensible to assume that the extra 1.7 MHz is not
significant.)

|>
|> You want to argue with the co-founder of Hisoft? (laugh)

He was probably just being tactful and kind :-)

The ST was never in the same league as the Amiga. That much is obvious. The
Falcon has narrowed the gap slightly, but still has someway to go I'm afraid.

|> knock up a quick demo.

If you are able to change the screen address to certain quantised values (as is
often the case) then draggable screens are very difficult and CPU intensive
indeed. The C= 8 bits had HBLANK interrupts, and could only move the screen
pointers to certain locations in memory (256 byte boundaries for text screens and
8K boundaries for bitmap screens). The Amstrad CPC 464's screen was, I believe,
confined to the same 16K of memory all the time. The Spectrum (48K) could not
move it's screen pointers, and the Spectrum (128K) could have screens that
started on a 16K boundary.

|> comes with a 32Mhz processor.

But how you explain you can add FAST RAM, a 50Mhz 68030 w/50Mzh FPU
on an A1200 and still cost less than a Falcon?

Hey, why not just put a 25Mhz68030 w/ 25Mzh FPU and the price
is significatively less than a Falcon?

People on the Falcon must see that since the A1200 is cheaper in price,
it's easier to buy add-ons AND THEN compare to a Falcon.

And in the Fast Ram case, a US $200 gets you 2 Megs FAST RAM, 25Mhz 68881
FPU. I think it's even a bit less now.

you damn well imply it.

|> its just I don't post or reply without
|> hard evidence to back my claims. There is nothing wrong with being 'wrong'

Nope, there isn't.

|> - after all you seem to be rather good it Raist - your post tells me that you
|> are indeed threatened by my superior knowledge, and your email confirms that.

Not in the least. But take it as you wish.

|>
|> Did you notice my posts about the 16bit bus on the Falcon? I tell nothing
|> but the truth, I have nothing to hide.

You were wrong in some e-mail you sent me regarding the A1200 graphics vs Falcon graphics when I was still at IBM last year. And you were quick to harras, insult, whine and bitch (sorry for the words to those sensitive readers around).

Even when I tried explaining why I though it was impossible to do dual-playfields on the Falcon, in which I drew diagrams explaining my ideas, you just continued your insults.

You are far from educated Griff.

|> You just don't like me because I
|> proved what utter rubbish you talk.

Nope. And I don't talk rubbish. I attempt to seek the truth, like I did during 64-bit RISC Jaguar discussions (I like the Jaguar) and like I did during those 'Falcon benchmarks' last year- where I ran several programs on my machine and posted some numbers.

I have always accepted and welcomed any corrections. Just continue your 'superior attitude' Griff... time will tell who's more educated.

Yep, they are compressed. And Ham8 is also compressed. Ham8 is a nice
advantage though, on a computer that doesn't have full motion mpeg playback
capability. And by full motion I mean 24+ fps in full screen. The Falcon
doesn't have that.

Bullshit (sorry again, to those sensitive readers). You might
have some experience too, but you definitively want to despict the A1200
as pure crap.

|>
|> : I think the psychologists out there will see my point.

Yes, and I see it. And before you are going to say "Raist, talk
about things you only know", let me tell you that I have 15 credits
in psychology, which is my humanistics specialization that I have
to make as a computer engineer in my college curriculum. And is
one of my hobbies too.

So while you have showed you know a lot of things, you are very reluctant
to admit when you are wrong (which you have been already), and
the sheer 'insulting' you do on your posts just show how insecure
you are about what you post.

600. Jaguar's CPU? Some facts...

Newsgroup: comp.sys.atari.advocacy
Date: 1994-02-16 01:13:19 UTC
From: raist@rmece02.upr.clu.edu
Message-ID: <1994Feb16.011319.37706@rmece02.upr.clu.edu>
Source record: 18801

Well, I am subscribed to the Jaguar mailing list,
where a lot of interesting things are being talked sometimes.

Some food for thought, to those 'Tom RISC's' can act
as a wonderfull CPU, this quote comes from a direct
Id software DOOM developer, for the Jaguar:

--------8x CUT HERE 8x---------

From: Shawn Green <shawng@idcube.idsoftware.com>
To: "Atari Jaguar List" <jaguar-l@ctrc.idde.saci.org>
Subject: Re: Doom Question--
Date: Tue, 15 Feb 94 09:13:53 -0600
Reply-To: jaguar-l@ctrc.idde.saci.org
Sender: listserv@ctrc.idde.saci.org
X-Listname: <jaguar-l@ctrc.idde.saci.org>
X-Mailer: Mercury MTA v1.11.
Message-Id: <13A5EE760A@ctrc.idde.saci.org>
Status: RO

|> This also goes for Shawn Green:
|>
|> * Did you guys used the TOM RISC for graphic operations, or
|> general programming operations too?

Just graphics.

|> * How is the expected frame rate? I have seen DOOM on a GATEWAY
|> local bus 486dx2 66 Mhz.... I would like to know.

Not quie as fast, but we expect it to run at 20FPS.

|> * Will there be support for multiplayers? That would be cool,

|> even if it requires another Jaguar with another TV.... thinking
|> about the future here when the Jaguar takes over ;-)

Yes, you will be able to use the com-link to connect two Jaguar consoles togethe
r for multi play.

|> * Any expected $cost$ (if you can tell.... ;-))

I have no idea.

|> * CD quality music?

At this point we are not sure if we will have space to do digital music or not.
Rest assured the music will
be great either way. :D

-Shawn Green (shawn@idsoftware.com)
id Software

----------8x------- CUT HERE 8x-------

No flames, just some considerations:

* Why id software didn't use the Tom RISC for general purpose
tasks?

* I expected DOOM to run at 30 fps like on DX2 50Mhz and 66Mhz
PC's! Either the game could be optimized more for the Jaguar
or the Jaguar can't handle it. Since ID software are good
hackers, I suspect the truth lies in both.

* To be fair, in another post, DOOM on the Jaguar will use
16-bit graphics, which is twice the info on the PC... still ;-)

* They haven't set a release date yet.

* Will support multi-players, I don't know yet if it will
support more than two though. You need two Jaguars, uses
the ComLynx port.

In article <1994Feb15.232317.10790@infodev.cam.ac.uk> cpb1001@hermes.cam.ac.uk writes:
:>Well kiddies, which of these takes longer?
:>
:>1) Writing 2 16 bit pixels along a 16 bit bus at 16 MHz
:>
:>or
;>
:>2) Writing 4 8 bit pixels along a 32 bit bus at 14.3 MHz
:>

plotting 2 pixels on a 16bit bus takes two writes. ok?

plotting 4 8 bit pixels requires :

4 * 4 reads (4 reads if you consider 2 bitplanes to be read at once)
4 * 4 writes

if the pixels are together it takes:

4 reads / 4 writes.

>Gosh that's a hard one :-)

who's a silly boy then, again you dug a rather big whole for yourself.

:>If you write routines that draw areas on the screen pixel by pixel, I have some
:>bad news for you, you aren't doing it terribly efficiently. Chunky pixels are
:>better for texture mapping and such like, but I didn't buy my computer to use as
:>a Super Nintendo.

You obviously no nothing about scan conversion then. (lack of knowledge again
is showing , sorry Chris but you lack experience).

:>The ST was never in the same league as the Amiga. That much is obvious. The
:>Falcon has narrowed the gap slightly, but still has someway to go I'm afraid.

Sure the 1200 is better Value, but the Falcon is technically better overall.

>Chris Brown

:> Gee.. I had no idea MPEG used CMY ;-) What a concept, MPEG for printing ;-)

oops I mean't Chromiance/Luminace -> RGB colour conversion, want me to post
the DSP source I wrote for this?

:>>:>really bolster your argument either. As we've seen in your case, actively
:>>:>working on an MPEG viewer doesn't really help your knowledge too much.

it doesn't ? are u saying that I don't know what an IDCT is? I learn't
a hell of a lot about MPEG in porting it, see below.

>>:>Let's make it simple, what's a cosine transform? Just straight off the
>>:>top of your head --- no need to burden yourself with the discretization
>>:>of it, or any textbooks. Or even simpler, why use a CT in JPEG and MPEG
>>:>schemes? Why not a Fourier transform or a sine transform?

ok... off the top of my head,

the FFT is the fast implementation of the DFT (discrete fourier transform)
(DFT converts a sequence of values into their correspoding frequency
components).
IDFT gives back the original values.
There are a number of problems with using FFT /ST transforms for compression
one being that DFT produces complex numbers (yum), the real part being the
COSINE part and the imaginary part being the SINE part, so it is better to
just use COSINE transforms which doesn't use have any nasty imaginary parts.
(it does have the sideaffect of requiring fractional frequencies though which
can be a little upsetting).
DCT is more difficult to calculate than DFT but is closer to the K-L (karhuen-Love??)
transform, which is the best possible for compression.

Will that do for you Stefen?you are a physics student, I do computing I reckon
I have a 'fair' knowledge of signal processing even though I haven't studied
it - its quite sad that you should want to test me in this way, I respect
both you and Andre quite a lot.

> Griff ? Did you miss this part of the post ? I did not see any reply.
>Gee, could it be that Andre actually knows more than you? Can't be.

I never claim to know more than anyone, I didn't see this in the original post, answer is above.

> Here's a clue: Andre knows what he's talking about. His posts are
>consistently correct, and he does not make things up to make some machines
>look better than other.

I think you'll find that the reason mine and Andre's figures don't match is because the quantization routine used for 16bit true colour in my MPEG player was not using complex dithering, and the percentages were bound to be different.

> Another thing: I verified Andre's profiling results with a profiling C
>compiler here. I trust these figures more than some hackers estimations.

Yes .. Andre's results would be correct with 256 colour ordered dither (or whatever), because this is complex in itself.
Its more difficult for me to 'estimate' since the code is half DSP half compiled. I guess you write all your games in C and profile them? right ;-) ?!

:> Well, Griff... looks like someone's educating you.

I already followed up, he was just being pedantic about what constitutes research. New Algorithms for IDCT do come about, through related research, or does Research only mean some guy sitting down 24 hours a day working on IDCT? I think not, don't be pedantic.

I'm glad you quote my writing style, it obviously does what it is intended to do, theres an old saying 'If you've got it, flaunt it'. I've got it.

Tell me please What I have been educated on. We were only arguing over a few percentage figures for MPEG, and it turns out that the Falcon approach is difficult to compare to 1200 approach anyway. I quote from experience - I ported MPEG , so I was just speaking from my own experience, is that ok with you? Its ok quoting C profiler percentages but I sat down and ported this thing and re-wrote 20% of it in DSP assembler - I think this constitutes me a right to have an opinion - unlike you Raist.

The way I write is designed to
provoke, since it allows me to constantly prove people like you wrong. You get all hot-headed about my language, perhaps you should take a breath or something before you post.

The argument is about whether you can acheive the same effects as the COPPER
using HBLANKS - this guy now goes on to change the subject and go on about
the advantages of the copper.

:>|> The advantage of a coprocessor (like the copper) is that you get to avoid
:>|> both the interrupt latency problem caused by higher prioriy interrupts
:>|> than HBLANK and you get to avoid the number of cycles it takes to get into
:>|> and out of an interrupt. (Because of processor state that needs to be
:>|> saved this is generally a non-trivial amount). The copper doesn't have
:>|> the latency problem, and doesn't have the state save problem, because its
:>|> a seperate processor. In a 2 bus system like the Amiga (chip ram and fast
:>|> ram) or when the main CPU has instruction/data cache) you can even avoid
:>|> contention between the main CPU and the copper in many cases.
>|> andy

> Hmmmm.... looks like Griffin is getting MORE educated.

You think I didn't know all that already? I'll tell you some more about the
copper, copper usage is not FREE at all, four memory cycle times are
required for each 'instruction'. Yes it is more convenient than HBLANKS,
but this was not the argument - the argument was over whether the COPPER
could do stuff which HBLANKS couldn't :

Sure the copper is nice, but it doesn't really do anything that cannot
be acheived with HBLANKS and a bit of agro. The copper is really quite
convenient for games and demos. (you slagged off games and demos , as being
not 'useful' last time Raist ;-)).

What copper stuff have you programmed Raist?
I'll post some PLASMA source if anyone wants me too , to prove my copper
abilities. *yawn*

> Oh, c'mon, 'Defender of the Realms', show us how great you are (he he).

done.

I never argued about the Amiga base system - that may very well be.
If you ask Atari or a dealer, they will say the Falcon Base system is
the 4/80 (and that's what the developer docs say to expect as a
minimum too). Even Atari says that the 1/0 model is only for those
who want to do the rest on thier own...

>
> I wasnt referring to you specifically, but the its a fact that many
>Falcon owners complain that the base A1200 doesnt have fastRAM when I

>

Well, I would say that would depend on the percentages of A1200's with
fastram installed - I think that arguing that point here is rather
tricky, as proabbly 99% of those here have Fastram. However, I myself
have stayed away from this part of the A1200 argument...

<some stuff deleted>

Yes I do - Atari says so, and the dealers say so, and the dev docs say
so. That's a pretty big basis.

<more stuff out of there>
>>Your ignorance is astounding. The "hack" as you so call it, does a

And that's probably why the occasional game does not work - but like I
said, most do. My DFalcon actually is more comaptible than my STE
(6800 machine) due to the compat progam.

> You say the Falcon blitter is compatible with the STe blitter? I hope

Ok, I'd better stop arguing on this, since I myself have never even
seen the Linux source - I had just heard that there were hairly Intel
asm parts to it.

But - I think one of the reasons that the Atari version is behind is
the lack of interest for it. I can already compile just about
anything meant to compile for UNIX under MTOS. The only thing that
interests me at all about a linux port for the Falcon/TT is X-windows
- but now that MiNT has sockets, we could have an X-windows port
runnning as well.

>

I see you totally evaded the response. Your original point was about
non-standard ports.

About the DSP modem - Good question, I have yet to see it - but then I
need and have a 14.4k Faxmodem. I can also use my DSP to decompress
JPEGs... I'll agree that voice mail included at no cost would be
nice, nut I really have no need for voice mail, and if I did I could
buy such.

>Do you have a buffered FIFO serial port yet?
>

Sure...

>Atari can either try to cost reduce and place all those ports on the

And I can buy all of those for my Falcon, and get the same warranty.
And since I don't have to open the machine up every three minuites
like a PC, It'll last a lot longer anyway. A longer warranty would be
nice, but it's even nicer not to need to use that warranty...

>

>this cash flow.
>

ANd the reason that so many countries will be having Jaguar shortages
is the large US demand - do you think it is better for them to grab as
much market as possible in the US, or spread themselves in a
microsopic layer over the entire planet?

More generally, you just don't seem to understand niche markets all
that well. Pretty much all of the points you have raised above have
applied to the Amiga and Atari platforms for some time. But the
reason I have a Falcon and not a 486 Drone is that I enjoy my Falcon,
some of the software is a lot better and cheaper than IBM or Mac
software, and I find the interface a lot more fun.

I might be able to get more raw oomph for the buck out of a 486 or
Mac, but for me it would be rather like strapping an electric chair or
lace tablecloth on the back of a rocket. I wouldn't be too
comfortable either way...

Now OS/2, that is another story, and might yet tempt me into buying
such a machine.

You talk about the Amiga? Of course it does. Stefan refers to other
things it seems..... more than just long file names, etc.

>BASE-systems! I can add fast RAM to my F030 if I want to. Heck, I can >add
>a 50 Mhz 68040 too...

And the BASE (ie the lowest specified setup you can buy) Falcon machine
is only 1Mbyte ram which isnt even enough to run MultiTOS with any average
sized programs. Not much scope there for 16 bit samples either. So as I
pointed out in other posts, the BASE Falcon doesnt really compare very
favourably to anything, you NEED to go for the 4 meg RAM option.

>Fact is that the F030 beats the hell out of the A1200, thats why it
>costs more...

It costs more coz it has more AS STANDARD - ie DSP, 16 bit sound and
SCSI. Unfortuantely for Atari, most people dont need these right away and
arent willing to pay extra for them. Maybe thats why they sell a 1Mb
machine at 500UKP to entice poeple into the line.

The cheapest decent Falcon setup I have seen is from Silica Shop - 800
UKP for a 4meg/65 HD setup.

For 800 UKP, buying cheap too, I can get..

A1200 , 2 megs chipram standard (270UKP)
4 Meg fastRAM with SCSI and 25Mhz 882 FPU (Silica shop , 350UKP)
85 Meg 2.5" IDE HD (165 UKP from various sources)

Total: 785 UKP

Add 20 quid for a MIDI interface and you have a machine that is VERY
competitive on features with the F030 for a fiver more. It has more RAM
and HD space, and the processor will deliver more power since it has zero
contention FastRAM. It doesnt have the DSP, but for the vast majority of
computing application the 25Mhz 882 is much more useful. No 16 bit sound

either, but how many people need it?

>you to disagree with me, you are so *unknowledgable*, i code stuff like
>this
>daily, you don't.

Yes, HAM8 is slower for games. For useful computing things it is a lot faster - like Animation for example. More colours with a lot less memory to update. Of course, we all know how sucessful the Falcon platform has been regarding games, so I guess having a potentially good games mode is really useful. BTW How many Falcon games are there that use this 65k mode? Just about all computer games I have seen these days tend to use 256 colour mode which is addressed in a very similar way on both the Falcon and A1200 (planar modes on both). Of course, the A1200 has LOADS of AGA software.

>You can plot a pixel 8 times faster than an Amiga with the Falcon true
>colour
>mode , it takes 8 read/writes to plot a pixel in 256 colour mode on an
>Amiga,
>in TC mode it takes 1 (and less logic to calculate the address/pixel
>mask),
>so don't talk about stuff you know NOTHING about. I want you to reply >to
>this point -> I need a laugh!

Nicely manipulated there. You can indeed plot a SINGLE pixel faster in 16 bit chunky, but its *MUCH* faster to update a whole screen of ham8, or even to *UPDATE* a block of 16 or more pixels. Since most of the time, computers tend to update blocks of pixels, the Falcon isnt as fast as you think.

>Chunky pixels are SO useful for real-time stuff esp. 3D. OOOPSS sorry
>the A1200 DOESN'T HAVE A CHUNKY PIXEL MODE , which is why games-writers
>and
>demo-coders are racking their brains for techniques to simulate this
>mode.

Thats why games writers are falling over themselves to make Falcon games then. As I said, most games are now 256 colours and these are accessed in the same way on the Falcon and A1200.

>NO MY FALCON DOES 1344*600 in 8bit colour

I`m thrilled for you! Tell me, what effect does this have on the
execution speed of all the programs on your system? Since the Falcon
design forces programs to share contended video RAM, maybe a nice A1200
with fastRAM might be a better idea where there would be virtually NO
program slowdown as a result of high rez modes.

I`d bet a lot more A1200 have FastRAM than there are Falcon owners.
With WELL over ten times as many sold, even if only 1/10 have it, thats
more of a market than the Falcon.

Gavan.

Had that since '85 got that too, to a degree.

Can also mount or load virtually any file system, from BSD, minix, to
MS-DOS. Will all your old programs be able to deal with long file
names, in requestor boxes, etc?

} What a silly comment. The Amiga shell is a lot more powerful than UNIX shels in
} quite a lot of ways, eg:
}
} Command Templates (probably one of it's most powerful features.)

If you explain this, I'll get back to you...

} Regular expression pattern match for filename wildcards

Do me a favour - regular expressions originated in unix.

} Sensible command names

Oh please - use 'alias' to define them to whatever you want. Put it into your .cshrc or .zshrc file...

} Global environment variables set from any shell, not just the initial one

howsabout (in sh) . ~/.variables or something similar. Global namespace is a pain IMHO - although I recognise that occaisionally it can be useful.

Some questions:

Does the amiga recognise scripts with (something similar to)
#!/bin/sh
comment
script commands

Does it have command-line completion eg: if I type

ftp [TAB]
I get a list of places I commonly ftp to

or:
ls l[TAB]
lists all files beginning with l. Or completes to the only file if that is the case.

This is a standard feature of tcsh (my preferred shell). And it's programmable.

Does it have history mechanisms, so that up-arrow puts what you typed last on the line, in editable form ?

Does it spell-check commands and suggest replacements ? Even for its aliases / variables etc.

Automatically rescale to the window size you're using if you cahnge
it ?

These are genuine questions - I don't know the answers. But they
are off-the-top-of-my-head abilities of tcsh.
}
} Useful, yes, but at the expense of an efficient context switch. Maybe it would
} make sense to implement it on the HP-PA based Amigas when they are launched, but
} until then I'd rather keep my efficiency thanks.

It has sod-all to do with that. MiNT context-switches pretty quickly.
It's also getting better, with a veritable army of people working on
it. The source is available, you see.

Simon.

Anyother thing you didn't hit on is the fact the computer system your are
talking about only cost about 10X more than the jaguar. If I'm paying 2500
dollars for a computer system, I definitely expect it to out perform a 200

dollar unit.

Kendall, I have to disagree with you here. I was an Atari enthusiast for many years (still am). I found that the older Mac interface (sys 6.x) was actually very much like the ataris interface (I had no problem at all transitioning from atari to mac, the basic paradigm is the same on both platforms). There were of course differences, each had there pluses and minuses. Now system 7.x is a different story. I don't think that the atari interface has kept up with the mac, they've come out with some pretty interesting features and some time next year will have the micro kernal version out. .

Most animation will use DELTA compression (store the difference between the frames), so if one pixel changes yuo have to update or store the changes to the surrounding pixels that are affected or do some sort of on-fly calculation - since I have never seen the code or written a DELTA ham8 animation player I won't comment on how fast it is. How about someone with experience in this area posts and says how efficient HAM8 compression is and how much 'extra' data needs to be written or recalced.

You can add FASTRAM to a Falcon just like a A1200. W/o fastram the Falcon
has less contention - in this particular mode you get about 20% decrease
in memory bandwidth.

> Gavan (the MORON)

(sorry couldn't resist that one again).

:> I`d bet a lot more A1200 have FastRAM than there are Falcon owners.
:>With WELL over ten times as many sold, even if only 1/10 have it, thats
:>more of a market than the Falcon.

The argument was about what the Base system was. Since 99.9% of Falcon owners have 4meg/HD and would say that this is what people will develop for. There maybe more 1200s but a smaller PERCENTAGE of the owners have FASTRAM?

Actually the roms do support color, though only something like 16 colors.

Why do you feel this way? (unless it is the memory requirements, though you
can run a stripped down sys 7 in about 1.5 megs) System 7.X is heads over
heels better than system 6.x.

It's true! I am a BIG NewWave advocate! And that's not because I'm an HP employee (although if I wasn't, I probably would have never tried it...) To me, NewWave simply is the best way to work in Windows. I don't need the Progman Fileman combo-from-hell, in fact I don't need files at all! Most everything on my PC is an object under NewWave.

The latest version (4.12) is very FAST (blows doors on Norton), and it has serveral features that make sharing objects/files with non-NewWave pegans, oops! I mean "users", very easy.

Thanks, (it is fast!, 3 shifts and 3 ANDS or sommit like that)

one point is that JPEG is not really so good for ray traced stuff and there
is where you are most likely to get noticable banding. The quantisation give
near photo quality on a TV, on a monitor the quantization can be more noticable
on a monitor but then again dithering tends lead to a grainy appearance
sometimes.

You got to be kidding right ?, there are several ham8 anims on cd's for
the amiga (cd32 for one) you killed most of my message where i sad IF
YOU HAVE MEMORY TO SPARE. if you need need to fill more than use mpeg
WITH some hardware and thats what they did (ham8 on cd32 units without
mpeg and mpeg if a mpeg unit is found). you can get this here for about
$530 thats today (cd32+mpeg).

Funny you mention that. I've seen CDROM drives labelled "multispin" and
their max data transfer rate is 150KB/sec = single spin? I'll go back and
check out the brand name and post it here if I get a chance. I thought
that was a marketing ripoff. But this just shows that all other companies
should be held to the same standard as Atari is being here, and there are
many companies that are not following standards.

I'm using Dashboard version 2.0 with the Fun Disk installed. It should be
widely available everywhere. (Unfortunately I don't have access to any
secret HP-internal-only super-version of Dashboard :))

Thanks for the compliment on my desktop! As far as the fonts go, I tend to
change them fairly often. I get bored seeing the same thing for long periods
of time. And as for the backdrop, all I can say is "Go Sharks!" :)

Actually, that reminds me that I also changed the system font the Windows uses.
I forgot to mention that when I posted the GIF... I can't remember the
utility I used to change it, but it I do remember I pulled it off CICA or
somewhere...

While it sounds interesting... it won't make a smooth scrolling game.
Add the sprite movements, scrolling into account (plust game logic, etc.)
and there are problems.

I'd dare say 100% .. ;) ... I only knew of ONE person buying a Falcon 4/0 with the intent to run it off disks "as he did with the STE" ...

It took two or three weeks before he got a cheap SCSI ..

You know .. ;) .. The Falcon handles both IDE and SCSI-II as standard .... too bad all "machines" don't ...

Most 1200 owners play games, they DO NOT have FastRam ..

^^

Even when you need to blit from three different sources using an
AND/etc. operation? The STe blitter has only two sources-> destination,
which for some operations then you have to make the blitter act TWICE at least
(I think sometimes even three).

Or the '1.4-1.5' is taking this into account (I doubt it.)

> or
> 2) Writing 4 8 bit pixels along a 32 bit bus at 14.3 MHz
> Gosh that's a hard one :-)

To draw one 16 bit pixel you only have to do

move.w #$ffff,(a0)+

To draw one 8bit pixel you need to do

bset.w #1,(a0) ;update bitplane #1
bset.w #1,2(a0) ;update bitplane #2
bset.w #1,4(a0) ;update bitplane #3
bset.w #1,6(a0) ;update bitplane #4
bset.w #1,8(a0) ;update bitplane #5
bset.w #1,10(a0) ;update bitplane #6
bset.w #1,12(a0) ;update bitplane #7
bset.w #1,14(a0) ;update bitplane #8

This is just an example to show the drawbacks of bitplanes.
The code is NOT meant to be optimal, so please don't be
upset about it!

Are all you falcon owners music enthusiasts? Maybe speed was
an equal concern for the original poster in which the Falcon is
probably not the best choise. Falcon is THE BEST for MIDI but if
you want speed you'll have to look beyond Atari. Like IBMs and Macs.
If you are concerned for price buy a clone or a low-end mac.

Let's thin this discussion out at bit. I am a mac user, just thought
I'd let you know that my opinion is biased. Things to point out: Mac's have
DSP's if you want them and they come with software (video capture, video
editing, speech recognition, high-speed communication, voice-mail). Also
PPC will not be that expensize, about $2000 for the base mac model. This
includes a mac 14" monititor(Sony Trinitron if the trend continues), an extended
keyboard, a 150Mb drive, 8Mb RAM and an IBM emulator that operates at 486 SX25
speeds. If will be much more powerful the current quadra series of macintoshes.
By current I mean with a 33Mhz 68040 that could blow the Falcon away. No need to
flame me for the last statement even if somehow you don't think that it's true.
This makes PowerMac a very appealing choise for what $700 dollars more you
get 10 times the speed and more compatibility. Just something to think about.

For everyone's info, multispin refers to the ability to read certain types
of Photo CDs. Namely ones that have been recorded onto at several different
times. Or maybe I'm thinking of multisession, or maybe it's called two of
the same things, or maybe I am just confusing everybody. Anyway, I can't
call myself an expert, so correct me if you want.

Yes MACs are nice but so are Falcons and TTs. One can upgrade either
machine to be just as fast as one of your Macs (well not a PowerPC but
those are not out yet). Some people simply like Atari computers much more
than MACs. (things to point out: Ataris have great shareware and regular
software, are fun to program, have a great OS, great hardware etc...)

Didn`t you claim it was EIGHT times faster than an 882?

Then you changed it to `half as fast`

How does it compare after you spend time loading the DSP code, setting
up the variables to operate on, invoking the DSP code and reading the
results back into the CPU - is it still as fast??? (as an 882 of 16Mhz)

>even compressed?? Isn't that the whole purpose behind JPEG/MPEG??

> Dan.

The whole point about MPEG is to play back movies at a decent quality from CD. Impressive though 15FPS at 1/4 full resolution on a Falcon is (I notice no one has mentioned replaying the sound too), this is NOT enough for people to watch movies, so really as an MPEG player machine the Falcon is out the window (not that MPEG playing ability is THAT important for a computer).

If you want a PROPER MPEG player, then only two machines currently offer MPEG - The Philips CDi (yeuuch) and the Amiga CD32 (Which can also accept a keyboard/fastram/HD etc - turning into an A1200) both have MPEG cards available. The 3DO is supposed to have one `soon` and Atari have indicated that the Jaguar CD add-on will be getting an MPEG cartridge shortly after it comes out.

I think the point is that when it comes to playing back animations on your computer system, the existing Amiga animation formats offered better replay rates or higher resolutions (sometimes with sound) than the 1/4 rez, 15 FPS , no-sound(??) MPEG on the Falcon. Plus of course, these formats are already `standard` on the Amiga and so there is a lot of support for them.

Having a really quick way of loading/saving JPEGs is genuinely useful though, so the DSP in the Falcon scores there.

: >and how great it looks ;-)
: >
: It's true! I am a BIG NewWave advocate! And that's not because I'm an HP
: employee (although if I wasn't, I probably would have never tried it...) To me,
: NewWave simply is the best way to work in Windows. I don't need the Progman
: Fileman combo-from-hell, in fact I don't need files at all! Most everything on
: my PC is an object under NewWave.

Yeah! I hate progman-fileman. It's really icky having to load up another
program just to hunt around for files. I prefer using AmigaDOS's show
all, show icons, show text options and combinations.

Your choice of fonts and background pictures weren't exactly the most
aesthetically pleasing. I hate those futuristic looking fonts.

The little app-dock, ala Next (also available under AmigaDOS) looks nice.
I've thought about removing all file descriptions from Icons under Windows.
I can't really do this under AmigaDOS, so I have to use an app-dock program.

I was wondering why the gadgets on the dashboard are so different from
the gadgets on the other windows? The 3d-a-like boxes around the text
are a bit odd. Did you munge the colour scheme slightly, as I would
have chosen shades of blue for a better 3d effect?

: The latest version (4.12) is very FAST (blows doors on Norton), and it has
: serveral features that make sharing objects/files with non-NewWave pegans, oops!
: I mean "users", very easy.

I'd probably buy it just for the docks. How much is HP Newwave for
students (if there is a discount, otherwise street prices)? How much
extra HD space and RAM does it take up?

>faster - like Animation for example.

Be precise: for full-screen replacement animation HAM8 may be equal to other modes (not faster, unless you face bus-contention problems).
For delta-frame animations (MPEG or even Eric Schwartz cartoons), HAM8 is worse than DC/TC modes.

>More colours with a lot less memory
>to update.

You won't face memory problems with delta-frame animation, you will face calculation time problems. With DC modes, a simple quantization is enough to get a REALLY good representation of the original MPEG, with HAM modes one has to implement LOTS of calculations.

>BTW How many Falcon games are there that use this 65k mode?

There are not too many games for the Falcon, but at least the French Wolfenstein 3D clone and 'Space Junk' seem to use it. Most demos also use this mode instead of 256 colours, seems it is fastest and easiest to program.

> Nicely manipulated there. You can indeed plot a SINGLE pixel faster in

>think.

A block of 16 or more pixels horizontally might be easier to update on the Amiga, because you only have to recalculate at the left and the right margin of the moved block, but for games (again) a 16 pixel wide object fills 1/20 of the A1200 screen. Not very likely that ALL objects will be that big, right?

>>NO MY FALCON DOES 1344*600 in 8bit colour

>design forces programs to share contended video RAM, maybe a nice A1200
>with fastRAM might be a better idea where there would be virtually NO
>program slowdown as a result of high rez modes.

First: the maximum slowdown of the Falcon is to 199% ST speed, according to GemBench. Second: There might be no PROGRAM slowdown with FastRAM on the A1200, but there surely is a terribly significant OUTPUT slowdown, esp. if you use 256 colours in 640*400@66Hz nonlaced. Even a 4000/040 is significantly slower here than a Falcon w/ NVDI. I use the Falcon with 752*560@66Hz in 8 bitplane mode.

A bit of a silly question Raist, its only 2 lines of code, not exactly
difficult to see how fast it will run if you know anything about the Falcon
(which obviously you don't). 2 reads and a write per pixel, quite simple thicko.

> While it sounds interesting... it won't make a smooth scrolling game.

8 times faster at integer arithmetic, as fast as a 20mhz 68882 as FP.

:> How does it compare after you spend time loading the DSP code, setting
:>up the variables to operate on, invoking the DSP code and reading the
:>results back into the CPU - is it still as fast??? (as an 882 of 16Mhz)

The FP code would be loaded into the DSP in the compiler's initialisation code. (The transfer to the DSP is included in the comparison, the 68882 has to read the FP data anyway).

>>|> move.w (a0)+,d0
>>|> move.w 0(a2,d0.w*2),(a1)+
>>|> you repeat this loop say 60 times and fit it nicely in the cache, so even
>>|> with the 030 you get 17FPS.

Griff here with an interesting point to note:

if I replace this code which does two pixels :
move.w (a0)+,d0
move.w 0(a2,d0.w*2),(a1)+
move.w (a0)+,d0
move.w 0(a2,d0.w*2),(a1)+

with this code:

move.w (a0)+,d0
move.w 0(a2,d0.w*2),d1
move.w (a0)+,d0
swap d1
move.w 0(a2,d0.w*2),d1
move.l d1,(a1)+

(so i am basically writing longwords instead of words)
the code goes 15% faster. (16bit bus crippling????! hmmmmm....)
I find this quite interesting, some other 68030 experts care to comment?

Griff
--

PS. With a 3/4 size screen window there would be some time for game logic
and stuff, but the main point was that the Amiga cannot even do a mode like
this.

The same thing can be said about the Mac....it has much and great
shareware, it is fun to program (at least for me), the os is very
intuitive and easy to use, there is a lot more and diverse hardware
available for the mac than the atari and amiga combined, and finally, there
is nothing out therein atari or amiga land to make it faster than an Mac
840AV. Not taking into account the DSP, it is as fast as a 486/66 local
bus machine...in combination with the DSP, nothing short of a pentium or
ppc can touch it. Thats not to say I don't like my atari, because I do,
but I also have to face the fact that atari and amiga will always be a
niche computer.

|> Amiga advocates would have people believe.

Yes, it's versitile, but not partcually suited for use as an FPU, being an
integer chip.

|>
|> its interesting to note that the 68882 does large integer stuff too. Its also
|> interesting to note the DSP can outperform a 50mhz 68882 in this area.

Well, isn't that surprising, since integers are a subset of real numbers?

>I mean "users", very easy.

NewWave was what got me into OS/2. I realized I was running NewWave
(which I really liked), and that required Windows 3.0, which in turn
required DOS 5.0 (all version numbers at the time I was doing this of
course), and I also owned Personal REXX. I was trying to keep this
all integrated together and the cost of just one of these products
upgrade would about equal the cost of getting OS/2 2.0 which more or
less had all four of these products integrated together. Plus I got
multitasking and flat memory.

However I still miss NewWave's trashcan which I think is the best I've
seen. You can tell it to keep 20 files in it. The 21st file to go in
causes the oldest (1st) file to be deleted. I much prefer this to
Apples emptying of the whole can (which NewWave can do too) or IBM's
first in-first deleted based on a total storage pool size, e.g. keep
20 megabytes worth of deleted files.

newsgroup.
>You would most likely get a reply from a Motorola engineer,
>who helps build systems from scratch and knows enough about the
>processors to debunk all these "facts".

Yes, I find it quite incredible that Falcon owners go on about `maybe
there is emulated 32 bit access` or `it seems to go a lot faster than it
would with only 16 bit access` when arguing that the 16 bit CPU to memory
bus on the Falcon doesnt affect performace. Surely the specs must be there
to support their claims? Or maybe they are just adopting a typical Atari
advocate tactic and making things up.

> All these half-baked, cache bound tests are just bunk. Same goes with
>these test cpu-ram tests in the TT. If the ram is clocked at 32mhz,
>how on earth is a 16mhz cpu going to access it at 32mhz, which the x4
>theorectical claims it should be?

I can see how it would be possible for a custon memory controller to do
2 16 bit puts/fetches off a 16-bit/32 MHz bus, and present the CPU with
what looks like a 32 bit/16 MHz bus, but if the Falcon has one then it`s
incredibly strange that none of the Atari advocates seem to be able to
produce any mention of it in official or developer documentation.

I would suggest the lack of proof indicates VERY STRONGLY that the
Falcon DOESNT have such a setup. It doesnt seem to stop the advocates in
this group going on about one though ;-)

My suggestion for a test would be.....

Switch the caches off first
Then time 10000 16 bit word fetches
Then time 10000 32 bit longword fetches.

If the effective bus width is 16 bits, the longword fetches will take
twice as long,
32 bits of effective access will mean that both timings should be the
same.

Note that the caches should be off, otherwise you could just fetch the
same longword 10000 times from the cache.

If they are the same, it would go a long way toward boosting the arguments of Falcon owners like Rickard Troedsson who repeatedly claim that some sort of 16<->32 bit buffering is being done to feed the procesor 32 bits at 16MHz. There would still be the problem of contention with the custom chips though.

If anyone has an A1200 with a 16 bit PCMCIA fastRAM expansion (I have one word - WHY?) and also a normal 32 bit fastRAM expansion then they could try the same method on it by way of comparing the sort of effects we can expect to see in 16 bit access systems.

Gavan.

> * move.w (a0)+,d0
> swap d1
> move.w 0(a2,d0.w*2),d1
> move.l d1,(a1)+

you replace 2 (a1)+ with a long (a1)+ which should be same speed because of
the '16bit bus claimed by others'
but you add a swap and a move, so all in all it should be slower.
This was the resoning on a 68000 or crippled 68030.
But as it's 15% faster this 68030 seems not to be put down to a 68000 bus.

Nice.

|> 4 * 4 writes

Whoops, good point. I forgot to compensate for one system being chunky and the other planar. Try plotting 32 horizontally adjacent pixels in 16 bit direct colour mode vs HAM8, and I think you'll find that the Falcon needs to perform 32 16 bit writes, wheras the A1200 needs only to perform 8 32 bit writes. Now which is quicker?

|> :>If you write routines that draw areas on the screen pixel by pixel, I have some

|> is showing , sorry Chris but you lack experience).

And you obviously know nothing about unrolling loops for speed optimisation and getting the RAM chips to go into column access mode to reduce the access time. (however, since memory access takes so long on the Falcon anyway, it probably doesn't make much difference.)

|>
|> :>The ST was never in the same league as the Amiga. That much is obvious. The

|> Sure the 1200 is better Value, but the Falcon is technically better overall.

Matter of opinion. The majority of people would probably disagree. the Amiga has it's elegant bus structure, 24 bit palette, faster access to RAM, all the clever AGA stuff, runs a nicer operating system, and has a nicer case :-). The Falcon has it's DSP, a slightly faster pixel clock and it's SCSI interface that pretends it's a SCSI II :-)

The Falcon games only have 256 colours because they are either backed by Atari and 'have to' use a mode which consumes lower memory OR are straight ports from the PC which is mostly limited to 256 colours.

There are plenty of Public Domain/Shareware offerings that use True Colour which are infintitely better than the plain boring 256 colours ...

Simon

The "app-dock" is HP Dashboard, a separate product from HP NewWave. It is meant to be a Windows shell all by itself, but I have found that it makes a good companion to NewWave (the window on the top half of the screen).

Dashboard is really meant to be a "minimalist" shell. It doesn't have all the features of Norton or PC Tools, but it can launch programs quickly, it can manage multiple desktops and printers, and has a resource monitor, and a few other handy tools...

The 3D effect around the icon text in NewWave is an option you can turn on or off. I like the way it looks, so I have it turned on. The color scheme is interesting, though! That particular shade of blue appears only on my HP

UltraVGA card! If I select that exact same color on my clone PC at home, or on a regular VGA screen, it looks completely different (it's much darker). I guess it's some quirk of the UltraVGA card that it doesn't properly render that shade of blue.

If you want the docks, buy HP Dashboard. I think it retails for around $40-50; you might be able to find it for less... HP NewWave sells for around $80-100...

:Too bad they don't make ANY Ham8 movies for CD then eh? I guess they must have
:overlooked that Wonderful format when they designed MPEG then right? Is HAM8
:even compressed?? Isn't that the whole purpose behind JPEG/MPEG??

You appear to have ZERO knowledge of what's what.

JPEG: Developed to store 24 bit animation using a loose compression.
Squares of pixels are "quantized". The quality is affected by the size of
the squares. To display a JPEG, it must be decompressed FIRST.

HAM8: A TOTALLY different type of loose compression. Allows 256,000+
colors in 8 bits (normally 256 colors). Compression is achieved by
modifing the previous pixel in a scan line. To display HAM8, compression
is done by the video co-processor. This is excellent for displaying, but
extremely CPU intensive when modification is needed.

MPEG: An animation format that is CPU intensive when a custom board is
not present. Compression is done with JPEG-like compression techniques.
Other compression techniques include vector/movement detection. This was
developed by a group who had no interest for platform specific applications.

CDXL: This format contains MINIMAL compression (maybe NONE). This is MUCH
less CPU intensive than MPEG, and fast speed are possible, even with lowly
CPU's. This was developed with the AMIGA (CDTV) in mind. As CDXL is
Amiga specific, it ***CAN*** be displayed in the HAM modes.

CD32 as it is out of the box CAN display HAM8 Animations using CDXL.
With the optional MPEG board, HAM8 Animations are possible, contrary to
what you believe.

I don't understand why you state: "Too bad they don't make ANY Ham8 movies
for CD then eh?". Could you please clarify this? A ham-8 appears just
like a 256 color picture when stored on disk, so why can't ham8 animations
be saved to CD-ROM?

About this: "I guess they must have overlooked that Wonderful format when
they designed MPEG then right?" Who are you referring to when you
mention "they"? If you are mentioning Commodore, they didn't design MPEG.
If you are referring to the MPEG group (name slipped), they had NO
display mode in mind, really. If they did, it'd be a TRUE-COLOR board (16
million). Therefore, many PC's fall short, along with most Amigas...

"Is HAM8 even compressed??" It's actually compressed twice. Once with
loose, raster based compression. Then when the display is saved to disk, it's
usually compressed with ByteRun1, which isn't real efficient, but is quick.

"Isn't that the whole purpose behind JPEG/MPEG??" You appear to be cross-confusing Picture/Animation formats with Display modes.

Once again:

JPEG. A compressed picuture.

file <-> 24 bit picture data (8-bit grey is possible, btw)

MPEG. A group of compresed frames.

file <-> 24-bit frames

HAM8. A display mode.

HAM8 (DISPLAY) approx. 256,000 colors (NOT 24 bit true)
but,
ham8 file <-> ham8 display

(The arrows indicate directions the data can pass WITHOUT any conversion.)

Therefore, any display not capable of 16.8 million colors needs to decode a JPEG/MPEG file before displaying it. This means those 18 bit display cards for the PC clones, also. And of course, this means any HAM8 display modes, too.

btw; My 50MHZ 68030 equipped 1200 can display most MPEGS at 6-8 fps in HAM8 mode. 8-10 fps in 256 color mode. And even faster in 256-level grey scales, approaching 14 fps. This is without a math coproc.
If I convert an MPEG (160x100) to a Ham8/Anim-8 format, 30 to 60 fps is possible. (320x200) can play at 15 to 30 fps. (You doubt me?? Send me a video tape, and I'll show you.) It's always funny to watch a converted mpeg being played at 3x the ordinary speed...

crandall@garnet.msen.com
If all this text didn't clarify things, then you are hopeless.

I prefer Apples emptying routine. If the trash can is not emptied then
hard disk space is tied up until it does. I use MacTools 3.0 with it's
trash back extension for recovering trashed items. It adds another menu
item to the Special menu and uses a hierarchical (spelling) menu system to
recover deleted files.

Err, you lost me there. Do you mean what do the new features have to do
about the user interface (lotts, these features are incorporated into the
interface) or the micro Kernal? (this has less except it will introduce
pre-emptive multitasking and protected memory, which indirectly affects the
user interface)

You mean Multi-session not Multi-Spin. Multi-Spin CD drives should be able
to put out data at 300kb per seconds, at least in a burst from it's cache.

Only turn off the DATA CACHE leave the INSTRUCTION CACHE on
This ensures that you are measuring only the data fetches.

|> Then time 10000 16 bit word fetches
|> Then time 10000 32 bit longword fetches.

Make sure they are long word aligned or the test is invalidated.
Also if they are not long word aligned the A1200 will appear
to have a 16 bit data bus, because the 68020 will be forced
to perform two bus accesses to get teh desired 32 bits.

|>
|> If the effective bus width is 16 bits, the longword fetches will take
|> twice as long,

Raist is so stupid sometimes!

to plot 4 pixels you need to read the existing bitplane data and modify
the appropriate bit for each bitplane. If you simply wrote 4 * 4 longwords
then any bitplane data on the screen would be corrupted.

>|> 4 * 4 writes
>|>
>|> if the pixels are together it takes:

yes to copy 32 pixels, but not to calculate

Faster for copying memory, but for PLOTTING or scan conversion of
textures or changing data - NO WAY thicko.

>|> >Gosh that's a hard one :-)

What because I was right? You really do hate me Raist don't you, but
I understand why, because I always correct you. It must be really
annoying for you.

Lack of self-esteem? what? You are the one who just wrote some completely
stupid text about how many writes it takes to plot 4 pixels on a 1200.
You didnt even realise you had to read the original data and mask the
new pixels into it - THIS IS BASIC KNOWLEDGE - ARE YOU TOTALLY STUPID!
I just lap this guy up, he keeps coming back for more and more.

Well, Atari is scheduled to have at least 4 more games released by the end of April
(Tempest 2000, AvP, Checkered Flag II, Club Drive). Third party games should be hitting the shelfs starting in March.

In June two or three more games are scheduled for release (Kasumi Ninja, Star Raiders, Tiny Toon Adventures)

Hi,

The reason Atari does so badly is because they don't support their users or their retailers. Waht can they expect if there is no way the customer can resolve his or her problems if they fall on deaf ears. They give their dealers no support materials or ways to generate sales, so what can they expect their dealers to do but drop the ATari when it doesn't sell.

I have stock in the company, and I know what's going on (at least what they tell you in the annual reports), and these guys don't know how to run a business (unless you're looking for a tax shelter). They're just lucky I don't live in California, because if I did, I'd drive over there and kick their tushes!!! I can run my business with their computers, but they can't run their business selling and making their computers!!!!!

AAARRRGGHH!!!!!!!!!!

---Beth---

Something up there is wrong.

At the very end, you write memory and when you have at least a 32-pixel
equivalence, the 32-bit bus will win (is faster).

|>
|> >Gosh that's a hard one :-)

The Falcon should be... a shame a computer with 1/4th the price of the
Falcon (or 1/3rd) would be worst. Problem is that with 1/2 the price or
2/3rd's of the price you can have an overall faster system ('30 expansion).

|> If all this text didn't clarify things, then you are hopeless.

Just wanted to mention that I have achieved 30 fps in overscan Ham8
with big deltas between them with my '030 @ 50Mzh accelerator.

Of course, it takes memory! ;-)

I have been able to play from 5-6 seconds (of 30fps in ham8 384x242- overscan
) to 10-15 secons (average anim, 30fps in ham8 384x242 with overscan). This
is using Scala's Animx32 format. I think Anim7 is even faster.

Scott, there's a problem. At least here in the U.S. you can get
for about the price of a Falcon a new low end mac which has
an 68LC040 (no FPU), with 8 megs, System 7, 40 (80?) megs hardisk,
keyboard and monitor. I think this setup will be faster than a
Falcon... (and an amiga around that price) for a lot of things.

>--

Yes that is very true but I was trying to point out that all (or most) of
those options and features are available on all the machines including Atari.
True, the Atari may not be THE fastest machine but you can get something
pretty damn close.

In other words the argument of 'go to the mac because it has x features'
is pointless because Atari machines can also have x features.

But, than again, The LCIII costs less than a Falcon. LCIII 4/80 with keyboard costs $750 while the 040 Quadra 605 4/80 with out keyboard costs $850. How much does your Falcon cost? Last I checked it was $1200 with harddrive.

I can get the LC575 5/160 with Keyboard for $1600. This model includes an 040-33mhz with fpu, trinitron display, dual speed cdrom.

These models are upgradeable to the Power PC

Fool fool fool fool fool fool fool fool fool fool fool fool!!!!!!!
The base Falcon is a 4 meg 84 megHD setup. That is what is stated in the
developer docs as the base machines developers should make software for,
and that is in fact the base machine that they do make software for. I
have the developer docs. You do not. Please do not spout gibberish about
subjects you are completely ignorant of.

To be very fair Beth... Commodore is exactly the same. Perhaps
the only difference is that they have a bigger market right now....
Good technology fell on their hands, and they didn't take much
advantage of it....

Atari was smaller to start with, and that's were they are :-(

Let's set it straight: if there WAS a CD^32 with 6 megs of RAM, keyboard, SCSI hdd, hd disk drive, MPEG cart and all ports in a CDTV case, for less than 800 US$, I'd buy it at once. There is no such thing. Period.

In ST Review this month, th editor, Vic Lennard noted that his Falcon was faster than his 40Mhz 68030 based Mac. He said that the Macs re-draws were painful compared to the quick response of his (NVDI) equipped but otherwise standard Falcon. He added that his Mac is faster now after having a 32Mhz 68040 fitted but the 'upgrade' was nearly twice the price he paid for his Falcon so it ought to be!

Yes they know of the processors... But not about ATARI Falcons architecture..

The processor in Falcon IS a Normal Motorola 68030, wich has a 32bit
data bus... I don't know how ATARI made the Falcons Data bus, if it's
16 bit wide clocked at 16Mhz, OR 16 bit wide and clocked at 32Mhz and
with some kind of logics wich make the bus look like a 32 bit wide,
16Mhz bus to the CPU...

>All these half-baked, cache bound tests are just bunk. Same goes with

>theorectical claims it should be?
>
Well... The TT is clocked at 32MHz both for the CPU and RAM!!!
And has a 32 bit data bus!!!

Just a few early machines was released with a 16MHz CPU...

Really, and how many time have *I* proved you wrong?

|>
|> A1200 sales are picking up? Not where I live. (Which is the area I'm concerned
|> about)

Yes, I know. You still think the sun revolves around where you live.
Not surprising.

Maybe what you are experiencing is more 'Falcon owners' that didn't
log to your BBS.

The machine must be selling, no doubt- kind of like the Neo-Geo-> it
sells very slooooooooow.

I got the answer already from the Id developer. Basically the
68000 does it.

|>
|> RH> * I expected DOOM to run at 30 fps like on DX2 50Mhz and 66Mhz
|> RH> PC's! Either the game could be optimized more for the Jaguar

|> ... when networking 4 players it's down to 4-5fps ... I do hope the Jaguar will
|> handle that part MUCH better ...

The frame rate for a 486/DX266 with local bus is in the order of 35fps-
as the Id developer said later on.

However, the Jaguar is doing twice the info (16-bit graphics), so
in that regard, it's a bit better.

|>
|> RH> * To be fair, in another post, DOOM on the Jaguar will use
|> RH> 16-bit graphics, which is twice the info on the PC... still ;-)

The bitmaps are the same- at least that's what the Id developer
implied.

|>

Well, I'm willing to post some WB stuff if no-one objects. I normally run in 800*600 in 16 colours using the Magic Workbench icons, but I can easilly get an out of the box setup. Like to see what peoples opinions on bandwidth are before I go ahead though.

|> For delta-frame animations (MPEG or even Eric Schwartz cartoons), HAM8 is
|> worse than DC/TC modes.

The Eric Schwartz cartoons are BOB based, not delta anims. IFF-ANIM's are delta anims, and HAM8 is no worse than any other 8 bpp mode for these, but you get a lot more colours. (Unless of course your definition of delta is referring to the idea of moving sprites around, as opposed to stroing the parts of anims that have changed, which is the usual meaning of a delta animation.)

|> There are not too many games for the Falcon, but at least the French
|> Wolfenstein 3D clone and 'Space Junk' seem to use it. Most demos also

It would do, since planar modes are not well suited to this type of game.

|> use this mode instead of 256 colours, seems it is fastest and easiest to
|> program.

Depends on the effects you want to achieve. A cross fade from one 16 colour picture to another, whilst they are both rotating in different directions, as seen in the first Team HOI AGA demo, is a LOT easier to do in a 256 colour planar mode.

use the CPU for integer, the 68882 is a FLOATING POINT unit. You keep harping on about how fast this DSP is at FP without a shred of evidence to back up your claims. Care to post some Whetstone results?

From the Modern Atari System Software book by Hisoft:
The 68030 takes about 28 clock cycles to perform a 16bitx16bit signed mult to
produce a 32bit result. About 571,000 multiplies a second on the Falcon.
The DSP at 32Mhz takes 2 cycles to do a 24bitx24bit multi for a 48bit result.
16m mults a second.
The DSP also does some things in paralell. You can do 24bitx24bit mult with
56bit addition to the result. do 2 data moves, 2 pointer updates and an
instruction pre-fetch in *2* cycles.

Yes. that is because Watcom C is to say the least rather good AND the fact
486's(like my new one) are rather fast. However the screen drawing routines
are still written in assembler. It would be silly to write game logic in
assembler when the C compilers are so good and the machine so so fast.

>Well... The TT is clocked at 32MHz both for the CPU and RAM!!!
>And has a 32 bit data bus!!!
>

All the support chips -- the memory controller, graphics chip, sound chip,
drive controller -- are clocked at 16MHz. This results in a computer that
operates significantly slower than 32MHz -- 25MHz, maybe. Without the cache
on, the computer is basically a 16MHz machine. This is the exact same design
as the Mega STe.

And RAM is not clocked. On machines with synchronous buses, the bus is clocked,
but RAM is not.

>Just a few early machines was released with a 16MHz CPU...

Only early developer machines had a 16MHz CPU. The 32MHz was a quick add-on
because Atari realised a 16MHz 68030 was not exactly leading-edge material.

|> advocate tactic and making things up.
|>

I've done testing on real world applications comparing the Falcon to a MegaST with a 16 MHz accelerator. The applications were things like file compression utilities and JPEG decoders (not using the DSP) and I used the same application in the same graphics mode on both machines. My test showed the Falcon to be 3 times faster than the Mega in 8 Mhz mode and nearly 2 times faster with the Mega in 16 Mhz mode. This isn't speculation or 'feel', but actual stop watch timings of an application completing a task. Granted that my hand eye coordination could have resulted in a +/- one second error at best, the difference in timings between the two machines was significant enough to make the error negligible (ie the tasks being performed took anywhere from 30 secs to several minutes).

I have also seen post from other people who showed the Falcon to be roughly half as fast as a 32 Mhz (32 bit bus) TT030.

So does this sound like a 'crippled' 16 bit bus Falcon????

I'm not saying it is not as good as it could be, but certianly not crippled!!!

Have any of you folks bitching about how 'crippled' the Falcon is with its 16 bit bus ever even laid eyes (let along laid finger to keyboard) on a Falcon???

Notice how I never said one bad thing about Amiga or the A1200. That's cause I have never even seen one and I wouldn't know what the heck I was talking about if I did!

Subject: PowerPC Mac Specs!
From: fmorgan@vax.clarku.edu, Clark University
Date: 18 Feb 94 10:57:57 -0600

Here you go! I found these somewere and this is all I know!

Fritz
==========

Look for these models to be available on March 14 or sooner. These models are comming off the assembly line now!!!

Peter

==========

Power Macintosh 6100/60

Processor: 60-MHz PowerPC 601 RISC processor; integrated math coprocessor; 32K on-chip cache

Memory: 8MB of RAM, Expandable to 72MB
o 8MB on the logic board
o Two SIMM slots support 4MB, 8MB, 16MB or 32MB SIMMs

Video expansion: DRAM video support

Video expansion: DRAM video support

Disk storage: o 1.4MB Apple SuperDrive
o 160MB or 250MB internal hard disk drive
o Space for an internal 5.25-inch storage device, such as an optional AppleCD 300i Plus CD-ROM drive.

Networking: Built-in LocalTalk and high-speed Ethernet connections; AppleTalk networking software

Display capabilities: Built in support for 32,768 colors on the Apple ColorPlus 14-inch Display, Macintosh Color Display, and Apple AudioVison 14-inch Display; 256 colors on the Macintosh 16-inch Color Display Expansion Capabilities: Expansion slot for 7-inch NuBus card or processor-direct card (requires adapter card); high-performance SCSI supports up to seven SCSI devices

performance SCSI supports up to seven SCSI devices

Ports: Two serial ports (both can be used with Apple's GeoPort Telecom Adapter), SCSI port, Apple Desktop Bus port, Monitor port that supports an Apple AudioVison Display or other display

Sound: Stereo sound-input/output ports

Option configurations: Optional Power Macintosh 6100/60AV configuration available; SoftWindows software optional.

==========
Power Macintosh 7100/66

Processor: 66-MHz PowerPC 601 RISC Processor; integrated math coprocessor; 32K on-chip cache

Memory: 8MB of RAM, Expandable to 136MB
o 8MB on the logic board
o Four SIMM slots support 4MB, 8MB, 16MB or 32MB SIMMs

Video expansion: 1MB of VRAM, expandable to 2MB

Disk storage: o 1.4MB Apple SuperDrive
o 250MB or 500MB internal hard disk drive
o Space for an internal 5.25-inch storage device, such as an optional AppleCD 300i Plus CD-ROM drive.

Networking: Built-in LocalTalk and high-speed Ethernet connections; AppleTalk networking software

Display capabilities: Built in support for 32,768 colors on
Display capabilities: Built in support for 32,768 colors on the Apple ColorPlus 14-inch Display, Macintosh Color Display, and Apple AudioVison 14-inch Display and Macintosh 16-inch Color Display; 256 colors on the Apple Multiple Scan 20 Display; with additional VRAM, support 16.7 million colors on the Macintosh 16-inch Color Display and 32,768 colors on the Apple Multiple Scan 20 Display

Expansion Capabilities: Expansion slot for 7-inch NuBus card or processor-direct card (requires adapter card); high-performance SCSI supports up to seven SCSI devices

Ports: Two serial ports (both can be used with Apple's GeoPort Telecom Adapter), SCSI port, Apple Desktop Bus port; dual monitor support with one monitor port that supports and Apple AudioVision Display or other display, and one standard monitor port

and one standard monitor port

Sound: Stereo sound-input/output ports

Option configurations: Optional Power Macintosh 7100/66AV configuration available; SoftWindows software optional.

==========
Power Macintosh 8100/80

Processor: 80-MHz PowerPC 601 RISC Processor; integrated math coprocessor; 32K on-chip cache and 256K memory cache

Memory: 8MB of RAM, Expandable to 264MB
o 8MB on the logic board
o Eight SIMM slots support 4MB, 8MB, 16MB or 32MB SIMMs

Video expansion: 2MB of VRAM, expandable to 4MB

Disk storage: o 1.4MB Apple SuperDrive
o 250MB, 500MB or 1GB internal hard disk drive
o Space for an internal 5.25-inch storage device, such as an optional AppleCD 300i Plus CD-ROM drive.

Networking: Built-in LocalTalk and high-speed Ethernet connections; AppleTalk networking software

Display capabilities: Built in support for 16.7 million colors on the Apple ColorPlus 14-inch Display, Macintosh Color Display, and Apple AudioVison 14-inch Display and Macintosh 16-inch Color Display; 32,768 colors on the Apple Multiple Scan 20 Display; with additional VRAM, support 16.7 million colors on the Apple Multiple Scan

support 16.7 million colors on the Apple Multiple Scan 20 Display

Expansion Capabilities: Expansion slot for 7-inch NuBus card or processor-direct card (requires adapter card); high-performance SCSI supports up to seven SCSI devices

Ports: Two serial ports (both can be used with Apple's GeoPort Telecom Adapter), SCSI port, Apple Desktop Bus port; dual monitor support with one monitor port that supports and Apple AudioVision Display or other display, and one standard monitor port

Sound: Stereo sound-input/output ports

Option configurations: Optional Power Macintosh 8100/80AV configuration available; SoftWindows software optional.

724. Does C= and Atari have a future?

Newsgroup: comp.sys.atari.advocacy

Does C= and Atari have a future in the computer market?

Atari is dead as far as their computer division is. But Atari droids cannot see the light.

Lets face it C= and Atari will never do well in the North American market and various parts of the world such as Australia.

Once the Power PC macs come out on the market world wide on March 14 or sooner, the price/performance ratio will widen. A $2000 Power PC system($1700- my price) will be competing against a $1500 Amiga 4000/030 with out monitor and $1500 Falcon HD system with monitor(I am being generous with price)

:>|> 8 times faster at integer arithmetic, as fast as a 20mhz 68882 as FP.
:>
:>use the CPU for integer, the 68882 is a FLOATING POINT unit. You keep harping on
:>about how fast this DSP is at FP without a shred of evidence to back up your
:>claims. Care to post some Whetstone results?

Use the CPU for integer stuff when the DSP is 8 times faster? yeah right.

As for 'without a shred of evidence' - I posted FP dsp source to backup
my claim, anyone with a vague understanding of assembly/dsp would realise
how fast the chip is - obviously you don't fall into this category.
As for the whetstone I'll take a look at the Dr bub sources and see if
it mentions any benchmarks. But isn't the source enough for you? ooopppss
sorry I forgot your terminally stopid (oooppps insulting you again).

> on the fly. This 'real world' enough for you. BTW I have programmed such things

Actually, the PC can't change the screen address on an HBL. It generates VBL's
if you're lucky (typically you have to poll a bit, as some network cards use
the IRQ that the video cards like, and the video cards have the VBL interrupt
generation off by default), and no HBLs. You can sort of sync to an HBL by
programming a timer and keeping it sync'd via VBL's, but the process is messy
and innacurate. That, and the screen addresses don't latch until the next VBL,
so even if you did try to change the image source on the fly, the changes
woudln't take effect until the next VBL. At least according to the VGA hard-
ware specs that I've got...

SInce when could Macs change the screen address??? I remember one of the
problems game designers have on the mac is the fact that the fixed VRAM
prevents any sort of page flipping or scrolling from happening...

And what is a BOB? A Blitter animated OBject, right? This is a piece of
graphic smaller than the screen area replacing a part of the background.
BOBs are rectangular, aren't they? And even if they are not, where is the
fundamental difference between BOBs and other deltas?

It varies from card to card. I think ET4000 has this capability.
Syncing to the screen is possible, the multitude of PC Plasma demos proves
this. (I've not seen any copper effects that could not be emulated yet).

Let me guess... it is 1024x768 and probably filled with a lot of space that could otherwise have been reflected in a smaller space conserving pic of about 320x400.

I downloaded some of these desktop pics and was disgusted to find that most of them were full of backdrop patterns. Just a waste of my time, but I don't want to name any names. But I will name IRC handles, like xterm :).

In other words, why not just send a clipping of your desktop next time, and you will get the same point across.

Hi,

I think some of these people who sell computers are former used
car dealers. They prey on our ignorance and draw our attention away from the
reall issues, like how easy the computer is to use, what you actually want to
do with the thing, and what software you can buy with it.

Personally, I'd NEVER buy one of these packaged set ups. THey
generally have lots of things I'd just as soon leave out, and don't have
the peripherals I'd want. I'd like to see a computer store operate like a
Chinese restaurant menu. You pick the things you want from each group for a
set price. That way you get what YOU want, not what the manufacturers think
you want.

Okay, for just pixels I forgot for a moment about that. I was thinking
more among the lines when you have to just put something on screen, as
soon as we get to multiples of eight at least- the Amiga gets a huge advantage.

[stuff deleted]

|>
|> yes to copy 32 pixels, but not to calculate
|>
|> Faster for copying memory, but for PLOTTING or scan conversion of
|> textures or changing data - NO WAY thicko.

If you are ploting points, you are right. Then in games, you most of
the time don't do ploting.

|>
|> >|> >Gosh that's a hard one :-)
|> >|> who's a silly boy then, again you dug a rather big whole for yourself.
|>
|> > You obviously have an isecurity complex (lack of self-esteem again is
|> > showing, sorry Griff, but you lack esteem).
|>
|> What because I was right?

Nope. You are smarter than that, c'mon. Because of your 'you just
dig yourself', 'if you knew anything about this you'll realise',
'if you had programmed you'll realise how stupid your claim....', etc.

|> You really do hate me Raist don't you, but
|> I understand why, because I always correct you. It must be really
|> annoying for you.

Nope, it's not annoying. I have no problems when people correct me.
BTW, you are not always corrected me. I have even corrected you before
(remember the IBM mails?).

|>
|> Lack of self-esteem? what? You are the one who just wrote some completely
|> stupid text about how many writes it takes to plot 4 pixels on a 1200.

No, I just wanted to discuss the issue from a technical pointl.
No insulting necessary. It's the way you say the things that shows you
lack self-esteem or are insecure about yourself.

Like you said: 'don't talk things you don't know about', unless you have
taken psychology courses (using your words and logic).

|> You didnt even realise you had to read the original data and mask the
|> new pixels into it - THIS IS BASIC KNOWLEDGE - ARE YOU TOTALLY STUPID!

It is basic knowledge. I am not stupid, I know about it. I was looking
more at the discussion from a stand point of general memory graphics transfer
comparing both the A1200 and Falcon. For plotting those two pixels only
though, you were right. I know about it too.

|> I just lap this guy up, he keeps coming back for more and more.

See again? Here you show it again Griff: insecurity complex.

:> Okay, for just pixels I forgot for a moment about that. I was thinking
:>more among the lines when you have to just put something on screen, as
:>soon as we get to multiples of eight at least- the Amiga gets a huge advantage.
For a block copy the Amiga will be faster because there is less bandwidth
involved however :
only if the data to 'write' is known before hand i.e. (bobs). The advantage is
not 'huge' at all, drawing bobs on a true colour screen is very fast - as fast
or faster than blitting to an 8 bitplane screen since you only need to do
write the data of the sprite that is not zero (background colour) , rather
than have to mask and OR the sprite data. I have a true colour 'bob' rout
that will draw bobs twice as fast as an amiga blitter can blit them.
Do you want me to type the code? Its funny how I always produce code to
back my claims and you don't. (I guess this makes me insecure , right?(laugh)).
Want me to prove you wrong again? Perhaps Stefen or Andre would like to
comment on the technique of code generation for sprite routines, and how
applicable it is for a word per pixel screen. (Raist - do you even know
what I'm talking about? (laugh)).

:>[stuff deleted]
:>
:>|>

|>
|> If you explain this, I'll get back to you...

Read a book on the Amiga Shell, it would take too long to explain, but basically imagine a system of passing arguments where you can specify the type of each argument (ie argument, switch etc.), get help on the syntax to pass to the command just by typing command ?, and pass arguments in any order.

|>
|> } Regular expression pattern match for filename wildcards
|>
|> Do me a favour - regular expressions originated in unix.

I said filenames.

|>
|> } Sensible command names
|>
|> Oh please - use 'alias' to define them to whatever you want. Put it
|> into your .cshrc or .zshrc file...

How about having the REAL names sensible, and aliasing the esoteric UNIX commands?

|>
|> } Global environment variables set from any shell, not just the initial one
|>
|> howsabout (in sh) . ~/.variables or something similar. Global
|> namespace is a pain IMHO - although I recognise that occaisionally it
|> can be useful.

The Amiga shell has both global and local variables.

|>
|> Some questions:
|>
|> Does the amiga recognise scripts with (something similar to)
|> #!/bin/sh
|> # comment
|> script commands

scripts are executed by typeing their filename if they have the S flag set, or if
you supply them as the argument to the execute command

|>
|> Does it have command-line completion eg: if I type
|>
|> ftp [TAB]
|> I get a list of places I commonly ftp to

To recall the last command that begins with the letters you typed, press shift
up-arrow. If youhave something like the KingCON console device (a window handler,
it's still the original shell) you have filename completion too.

|>
|> or:
|> ls l[TAB]
|> lists all files beginning with l. Or completes to the only
|> file if that is the case.

See above.

|>
|> This is a standard feature of tcsh (my preferred shell). And

|> } until then I'd rather keep my efficiency thanks.
|>
|> It has sod-all to do with that. MiNT context-switches pretty quickly.

It has plenty to do with that. Rather than switching large segment/page tables around, a context switch basically involves a register swap. Not having virtual addressing helps a lot here. (Note that not having virtual addressing does not mean that memory protection is impossible. If anything, it makes it more lightweight.)

What makes you think I haven't? I know too that the AGA's blitter
isn't 4 times faster. BTW, the bandwith DOESN'T HAVE A DAMN TO DO
with the blitter (or any blitter for that matter). It's just how fast
you can transfer info through a bus, the blitter could be slower (in this
case it is).

So? I could have a background with a sky with a lot of colors...
how about the Falcon in that 64k color mode? The pallete won't be
enough to avoid banding (unless you use a TV screen).

BTW, using the copper on the Amiga you can even have three
playfields, and if my calculations are correct, even four.

I'll like to see the Falcon doing that...

It is trivial on The Falcon and STE,
the PC is more difficult and video CARD dependent.
I can post source for these machines that manipulate the video registers
for these machines if you want. (its funny how I'm the one always writing
source). I replied to your claim before and you had no answer other than
some whittering about 'oh.. but the copper makes it easier'. *yawn*.

> I'll like to see the Falcon doing that...

Yeah .. really, four playfields, explain to me please - I'd be real interested in this (laugh) - the copper cannot create 'playfields' as such - it merely manipulates the existing h/ware registers. Talk about not backing up your claim and lack of knowledge (oooppsss me being insecure again).

That's three machines. Now would you care to explain how trivial it is to do
on the other machines you mentioned? Spectrum, Amstrad CPC 464, Macintosh, and
the C64, (although it doesn't appear you knew this machine had an HBLANK
interrupt)

|> I can post source for these machines that manipulate the video registers

No, your reply was that on ANY SYSTEM WITH AN HBLANK INTERRUPT, draggable screens
are trivial to implement by simply CHANGING A FEW SCREEN REGISTERS. This is not
true. Stop trying to squirm your way out of an argument.

The spectrum,amstrad and c64 are YOU mentioned, they don't constitute real
machines capable of support a decent OS in my opinion,if I didn't know thte
c64 had hblanks how come I know about multiplexing sprites on it then?
(laughs at Chris's futile dig at Griff). I assumed the newer Macs (quadra)
etc had decent video h/ware.

>No, your reply was that on ANY SYSTEM WITH AN HBLANK INTERRUPT, draggable screens
>are trivial to implement by simply CHANGING A FEW SCREEN REGISTERS. This is not
>true. Stop trying to squirm your way out of an argument.

NO CHRIS, you were argueing that the copper was something special and could
acheive things which couldn't be done with HBLANKS. Dragable screens can be
implemented on ANY machine that supports HBLANKS and writable video registers.
I don't need to squirm - I am write, just like the DSP FP argument, where
source code wasn't enough for you, and you want me to post some meaningless
benchmark which I could probably bend to suit the DSP anyway. Is there
anyone out there who doubts the ability of the DSP at s/ware FP arithmetic?

|> with some kind of logics wich make the bus look like a 32 bit wide,
|> 16Mhz bus to the CPU...

There's a problem with that logic though. During last year,
there was a 'benchmark war' goin on here, in which I posted the
results of using caches & burst mode. Since the Falcon speed
improvement was far more than the average improvement I was getting
(and my card implements almost zero waitstate, burst mode access),
it is easy to conclude that the Falcon has a bottleneck somewhere.

The more you benefit from an internal cache, the poorer the subsystem
around the chip is designed. Even quotes from ATARI developer stuff
stated the Falcon had 16-bit data bus access. I think that this was
pretty much a dead issue.

You got an interesting point RandyH. Problem is some benchmarks
results posted last year, where the Falcon benefitted way to much from
its 68030 cahes.

This means that there is some sort of crippling somewhere... and I wonder
what the TT has in its design too!

But one more thing: the falcon should be more than just twice the
speed of a 68000 at 16Mhz.... this sounds like some crippling at work
somwhere...

and

I have read e-mail from two Atarians that have used the Falcon and
have found it slow.

Still you got a point, I base my opinion more on those benchmarks
than were ran and on OFFICIAL ATARI information that was posted here
last year...

And I was VERY polite to you, even when you insulted me in private
e-mail while I was working at IBM. Instead of pointing out why the Falcon
could do the dual-playfield stuff, etc. and correcting me *way before*
about the Falcon having bitplanes mode you only cared about insulting me
saying your typical "if you knew something about programming you'll
realise how stupid your....' etc.

IS THIS BEING POLITE?

| I respect Stefen and Andre, I
|> think you will find they respect me,

They respect you as much as I did, until you insulted me. Then why
should I respect you? And even with that, I have tried to be as polite
as possible... just continue with you attitude, because like I said,
time will show who has more education.

|> I doubt the same can be said for.

BTW, you didn't repsect very much Andre until he started kicking
your butt.

|> People who are blantly wrong or trying to spread mis-information deserve
|> to be flamed and you are pretty hot!

When have I tried to knowingly spread misinformation?
And if a person is blatantly wrong, was is the attitude: open the
fire thrower, insult them and that's it?

VERY MATURE RIGHT?

|>
|> >|> I never claim to know more than anyone,

What you fail to mention is the 1200 got around this fact by building the
'magic' and 'backwards' type utils into the ROMS. If I remember correctly, to
get a lot of older amiga games to run on a 1200 you can set up parameters such
as cache off, etc. upon boot-up, so having backwards/whatever is easily
comparable, no!?

A delta animation is one in which the changes between frames (the frame-delta) are saved, and has nothing to do with BOBs, MOBs or any other kind of sprite.

Griff, you are trying to change the subject again (squirm, squirm). I said
nothing about calculation. The user may just want to clear the screen, so I ask
again, which is quicker, writing 32 8 bit pixels along a 32 bit bus at 14.3 MHz,
or writing 16 16 bit pixels along a 16 bit bus at 16 MHz? (or even a 32 bit bus
at 8MHz if you prefer to think of it in that way.)

:> But one more thing: the falcon should be more than just twice the
:>speed of a 68000 at 16Mhz.... this sounds like some crippling at work
:>somwhere...

Wrong, the Falcon's memory access is x2 that of the ST for copying memory, for general programs it is 2.5-3.5 times faster (030 runs 68000 instructions in less cycles). It is about 4-5 times faster for maths (i.e. MULU/DIVU).
Yet another example of Raist talking through his BUM.

> *and*
>
> I have read e-mail from two Atarians that have used the Falcon and
>have found it slow.

Its funny I just an A1200 redraw 256 colour screens in 640x480 and it was about twice as slow as my Falcon in 800x608x256, (with NVDI) . I have about 30 pieces of mail a week thanking me for educating some of the people on this group. The Falcon is slow without NVDI though because the VDI is coded in C.

A is a subset of B if, and only if, for all x, where x is a member of set A, it is the case that x is a member of set B. If A is non-empty, and not equal to B, then A is a proper subset of B. Apply this to the two sets of integers (Set A) and reals (Set B).

|> expressed as a product or quotient of integers, ie: 0.5 can be expressed

Some of them can. Certain integers (ok, one integer) can be expressed as 1. This doesn't mean that the set of all integers is a subset of 1.

|> as (1/2), and .75 as (3/4). The exception of course being irrational numbers.
|> At least this is what I get from my math professors.

This trivial exception of yours makes the difference between one set having Aleph 0 elements, and having Aleph 1 elements, ie having the irrational numbers puts you on a higher level of infinity. If your Maths professors are telling you that the set of all integers encompases the set of all reals, then I'd ask them to change their day jobs.

(BTW, the set of all reals is a subset of the set of all complex numbers. They both have Aleph 1 members though)

> The explain why you were wrong and you admitted it about the A1200's
>capabilities for scrolling shotter type games (Shadow of the Beast, etc.)
>when you said that while I worked at IBM, and before you admitted it
>you insulted me...

No.. the argument was over whether the Falcon could even do dual-playfield
- I proved you wrong in this respect - I NEVER SAID THAT A1200 was not
better at scrolling shotter type games - anyway it is not much better for
games with a number of BOBS because you need to save and restore BOB
backgrounds on one of the playfields - on the Falcon since you are
redrawing the playfield this is not a problem. Yeah sure it might be
20% faster for certain scrolly shoot-ems - gosh I better go and get
an A1200 now.

:> I think we all commit mistakes. IS your continuing attitute
:>that leds me to conclude:
:> > You are very insecure about yourself< - like I said, check it out
:>in a modern psychology book.

If you say so ;-).
I think you just have the natural human response of not liking being
proven wrong.

:>or writing 16 16 bit pixels along a 16 bit bus at 16 MHz? (or even a 32 bit bus
:>at 8MHz if you prefer to think of it in that way.)

The Amiga can clear the screen faster than a Falcon - what an accolade.
The could copy a static bitmap (a picture) faster than a Falcon.

Enter the REAL WORLD:

Lets compare stuff like line drawing/ poly filling etc

THE FALCON CAN DRAW LINES ABOUT 3 TIMES IN TRUE COLOUR MODE THAN A 1200 IN
256 COLOUR MODE. Each pixel is plotted with:

```
; A little fragment of code

; dy>dx line draw case.

move.w #colour,0(a0,d0.w*2) ; a0-> screen
addx.l d1,d0 ; d1 contains frac/integer.w.
```

the blitter would need 8 blits each taking the maximum blitter time per
word. slllooooowwwww. The cpu loop would be about 3 times as intensive as
the above.

For poly filling - you need to do complex masking and have edge calc
ulations -TRUE COLOUR MODE DOES NOT REQUIRE THIS.

Face it - the Falcon is better for 'drawing' in this mode.
I'm not squirming either the argument started as whether the Amiga
could do gouraud/phong/tmapping as fast as a Falcon, somebody squirmed with
an engineered benchmark which they got wrong at first and then changed
it from 2 pixels to 32 pixels.
Care to post some stuff about line drawing/polyfilling in bitplane
modes? I doubt you even know how to write this type of thing - do you
even understand the above code?

Thats why the Falcon has a DSP. 20++ MIPS IN TOTAL.

As for 486 being crap, yes it is a badly bodged chip, however it is a
fast bodge!!!
You harp on about parallelism and stuff yet the 486 can outperform an
Amiga anything real world except the odd shoot 'em up (which lets face
it, is what it was designed for).

Perhaps a matter of semantics, but when someone says 'crippled' to me
it implies seriously handicaped to the point of being almost unusable.
As I said, I won't disagree that it may not be as fast as it could be
(even though I really don't know), it still does very well, considering.

>
> But one more thing: the falcon should be more than just twice the
>speed of a 68000 at 16Mhz.... this sounds like some crippling at work
>somwhere...

I realize that the 68030 is more effecient than the 68000, but how much
faster would you expect it to be when they are running at the same clock
speed?

>
>
> *and*
>
> I have read e-mail from two Atarians that have used the Falcon and
>have found it slow.

Slow compared to what??? Of course it is slower than the latest 486
machines and the faster clocked 68030/68040 Macs! But is it crippled?
I think not. And compared to the MegaST it is a significant upgrade.

>
> Still you got a point, I base my opinion more on those benchmarks
>than were ran and on OFFICIAL ATARI information that was posted here
>last year...

Well you can argue benchmarks and textbook theories all you want, but
the proof is in real world performance. Here is where it is of the
utmost importance to actually spend some time with the Falcon and see
how it operates. Yes, I am biased because I own one and no I am not
a power user always trying to push the envelope - so therefore I find

the Falcon to be a very usable system.

|> respect.

When you sent me mail privately to IBM you didn't even know that
I thought the ST was bitplaneless, so don't try to make an excuse now.
It was until recently, that you realized that. You didn't have any
respect for me since day 1 I received a private mail from you, in which
you basically insulted me and harrased me.

|>
|> :> I respect Stefen and Andre, I
|> :> They respect you as much as I did, until you insulted me. Then why

|> And you don't flame people?
|> let's face it - your a charred cinder.

Yes, I flame too- when people either insult me, ignore corrections and
considerations, etc. In that regard everybody flames.

But I don't see as very mature flaming just beacuse, even when there
could have been a misunderstanding or assuming things that obviously are
not necessarily true.

|>

|> >you insulted me...
|>
|> No.. the argument was over whether the Falcon could even do dual-playfield
|> - I proved you wrong in this respect - I NEVER SAID THAT A1200 was not
|> better at scrolling shotter type games -

Ah, ah ah! You said there was practically no advantage, and then you corrected yourself admitting that 'yes, ok, perhaps the A1200 has a small advantage using hardware dual playfields and scrolling.'

Don't change it, unless you want to admit it.

|> anyway it is not much better for
|> games with a number of BOBS because you need to save and restore BOB
|> backgrounds on one of the playfields - on the Falcon since you are
|> redrawing the playfield this is not a problem. Yeah sure it might be
|> 20% faster for certain scrolly shoot-ems - gosh I better go and get
|> an A1200 now.

The point is not whether getting an A1200 now or not, but whether you were wrong, INSULTED ME, and then admitted it quickly and continued your insulting.

|>
|> :> I think we all commit mistakes. IS your continuing attitute
|> :>that leds me to conclude:
|> :> > You are very insecure about yourself< - like I said, check it out
|> :>in a modern psychology book.
|>
|> If you say so ;-).
|> I think you just have the natural human response of not liking being
|> proven wrong.

No, that's not true. Whenever someone points that I am wrong in this group I have thanked that person for correcting me. I even did that with *you*. Don't make things up. The only exception perhaps is Rickard... and I got very good reasons for it. Why don't you 'educate him too?'

Again, apply yourself your advice: "don't talk about things you don't know about" - get hold of a psychology book and read for yourself, it's that easy.

I own an Atari 520ST, and have finally decided to upgrade to another Atari Machine, but cannot find a local dealer. I have no idea as to prices, hardware available (due to the local store no longer carries Atari Magazines...). Could someone post a list of "suggested retail prices" along with a list of current hardware (and capabilities thereof)? Thanks.

>comes with a 32Mhz processor.

>Brian

Yes, of course you can add 32 bit fastRAM to a Falcon (you call it TT
RAM don`t you?) but this is at extra cost to the price of purchasing a
4/80 Falcon. It also involves a messy board that sits in both the 030 and
882 slots doesnt it? Its not really an ideal solution, but it works. Dont
you think it would have been better for Atari to provide a proper 32-bit
datapath from the start?

The point is that for the price of a 4/65 Falcon, you can get an A1200
equipped with FastRAM ie. For the price of what Falcon owners consider a
`base` model, you can get an `upgraded` A1200. Sure the `base` A1200 only
comes with 2 Meg chipram but (in the UK at least) it IS possible to buy a
1 meg/no HD Falcon so either way you are paying `extra` if you like, for
the privelege of a decent amount of RAM and a HD (you see my point).
Therefore, I`d say that its fair to compare a fastRAM equipped A1200 to a
Falcon since the prices are around the same. Of course, you could point
out that the F030 has 16-bit sound and a DSP and obviously its going to be
superior for users who NEED this sort of thing, but for most people thats
not important which is why the Falcon has failed to catch on - it has too
much redundant stuff (thats redundant to most people, obviously some will
need it). The A1200 sells in a cheap configuration, but it CAN be upgraded
to a much higher level if needed and you can get a very well equipped
A1200 for the price of a 4/65 Falcon (SCSI, 6 megs, 80HD, 25MHz 882).

As I keep saying, dont compare the Falcon to a fastram-less A1200 as
its simply not a fair comparison. After all, what sort of a Falcon can you
get for the price of the base A1200?

Gavan

>>on this group ignore your posts.

So what? When you are carry out COMPUTING tasks, you are executing code
and processing data. All of this is carried out with zero contention, and
32 bits at a time) in fastRAM. When the CPU does access the screen it can
do it 32 bits at a time. Take a look at things like compilers - how much
time do they spend accessing the screen? By your arguement, the only sort
of software that is going to benefit is games (of which there is a notable
absence of the F030), so where does that leave the Falcon for computing?

>:> You see, Griff, a computer spends a lot of its time processing, and

>As for the Falcon being inefficient, thats why it has more video
>bandwidth,
>less contention, 20++ mips etc.

I can be sarcastic if I want to, but i prefer to use facts to back my
arguments up. I dont need to resort to insults like you so obviously do.
If you want to include a TT RAM expansion for the Falcon then fine, but
let me include a 50MHz 030 expansion for the A1200 then. After all, at any

given price level, the A1200 will outperform the Falcon CPU and its price levels that are important. C= COULD have sold A1200s with a min of 6 megs FastRAM and an 80 meg HD, but then they would have sold precisely as many as Atari have sold Falcons - sod all. This way, there are hundreds of thousands of A1200 owners and a few tens of thousands of Falcon owners. Which computer has the most software support, which has most hardware add-ons, which has the cheapest expansion options? I think that the computer buying public have spoken.

>The 1200 is far more games orientated than the Falcon, hence the h/ware
>sprites and copper , which are primarly used for games. I would happily
>admit that a 1200 is better for platform games. Gosh what at accolade!
>better at 3d games , *no way*, Falcon is at least 3 times better for this
>simply because of the DSP.

The hardware sprites are useful for things like pointers and the copper allows really easy multiple screens. Of course, they also make for good games but theres nothing wrong with that since YOU are always screaming about how great the 65k colour mode on the Falcon is for games (except that there dont seem to be many available.....)

>your rantings make me laugh, you have such weak arguments. FASTRAM FASTRAM
>FASTRAM... this is your only answer - do we want to compare Falcon with
>FASTRAM to 1200 to FASTRAM? come on I dare you.

Oh sorry, I`ll ignore the fact then that you can get an A1200 with
32-bit FastRAM for the same price as a Falcon ..... NOT!
Its a strong argument in favour of the Amiga architecture and if you dont like that, tough.

Go on, compare ANY like-priced Falcon and A1200 setup and see how much processor power is delivered.

:

>No... you implied that there was one 16bit datapath, which is clearly
>wrong,
>only the CPU has 16bit datapath. ok?

Read what I said, it said that the CPU shares its access (true) down a
16 bit path (true) with the custom chips (true). I didnt say that the
custom chips had only 16-bits access, but since you seem to be so paranoid
about any criticism of Atari products I can see how you would immediately
jump to the conclusion you did. In future I`ll try to phrase my sentences
more carefully for paranoid readers.

>The Falcon's 030 outperforms the 1200's 020.

Well, not strictly true. In an ideal environment, a 68030 at 16Mhz
would indeed outperform a 68020 at 14.2 Mhz (something like 3.6 MIPS vs
2.96 MIPS on paper). As implemented in the F030, the 030 would outperform
an A1200 with no fastRAM, but not an A1200 with fastRAM (for computing
tasks). Not a great problem for Amiga owners since they can get an A1200
configured with 4 meg FastRAM for LESS than the cost of an F030 4meg The
whole problem is the half-assed way that the F030 CPU architecture is
designed. Shared access, and only a 16 bit CPU<-> memory datapath does not
make for optimum use of the 030. Since anyone who wants to do serious
stuff on either machine will need at least 4 megs RAM, then you can assume
that anyone who is using their A1200 for advanced stuff WILL have fastram.
Since the OS will automatically use fastRAM where available, there is no
need to develop specially for fastRAM users as OS legal programs will be
executed from fastRAM if available.

If you dont need more than 2 megs RAM, then you are unlikely to
complain about the slowness of chipRAM. Owners who just play arcade games
will never know the difference, but any users wanting to do programming,
3-d graphics work , dtp etc. WILL want fastRAM and they`ll automatically
get it when they upgrade from 2 megs.

>The Falcon's 030 with TTRAM outperforms the 1200's 020 with Fastram.

And a SUN workstation outperforms a Falcon with or without TTRAM! Thats a totally meaningless statement. By the time you hoof out the moolah for a TTRAM expansion for your Falcon, you could have plonked a 50Mhz 030 with 50Mhz 882 and lots of RAM into the trapdoor slot of the A1200. Prove that the delivered CPU performance of any falcon can outdo any A1200 configured at the same price level. I think you`ll find the A1200 wins out in delivered power for the price EVERY time.

Gavan.

Well, its all subjective but tell me, are you comparing a standard PAL
display on the Amiga to your personal display which is probably on a nice
hi-rez monitor? If you are, a 640x480 NI is obviously going to outperform
a 640x256x4 colour TV image. The std 640x200x4col GEM desktop was
revolting -all that green, ugh!

Why dont you try to see a nice 800x600x8colour `magic WorkBench`
desktop - they look superb. If only I could afford the monitor to run one!
I`ll have to make do with my phillips 8833 until I can afford a nice
multisync.

>1 word per pixel is.

>>Gavan

>Griff

Oh, I see. You are simply calculating the screen manually before rendering it to your actual display buffer - thats NOT the same as providing dual playfields, its just a slow software emulation. The whole idea of dual playfields is that they act as two totally independant screens which you dont have to worry about or manipulate in any special way - not that you play around with software manipulation to get a similar *effect* at a reduced frame rate. This sort of software manipulation isnt very effective - just look at some of the pathetic attempts to do parallax on the PC - even a 486 produces dodgy results. Of course you HAVE actually done this to see if you can achieve 17 FPS in 320x200x dual 256 playfields? What are the results like - smooth games or not? Just what is supposed to do the processing for the game logic while your CPU is tied up *emulating* the dual playfields. And what speed have you managed to get the DSP to do it at? You *HAVE* actually tried writing the DSP code to back up your claims havent you ?

By the same token as you, I can do dual 512 colour playfields on my A1200 using HAM8 - of course, the screen update isnt real-time leading to jerky screens, but what the hell. According to you, theyre real dual playfields.

I can also achieve triple 64 colour playfields and both the A1200 and Falcon can now do Alpha channel graphics courtesy of a bit of time consuming software emulation! Who needs hardware any more, when you can write a bit of software to achieve the same result albeit much slower???

>makes games for the Falcon'. A stunning reply indeed. Thats funny most
>PC games use chunky pixels, or MODE-X if you even know what that is.

Actually, in my post I started off by pointing out that although a
single pixel write in ham8 was more time conuming than one in 65k colour,
that you could write a byte aligned block faster (you can write fourtimes
as many ham8 pixels in the same time as one 65k pixel if they are byte
aligned) and that there was only half as much screen memory to be updated
in ham8 compared to the 65K mode on the Falcon. Sure, modifying a mah8
pixel takes longer courtest of the need to read/write bitplanes, but
actually writing a screen is quicker.

Its perfectly valid to point out the dearth of games software for the
Falcon. Whats the point in crapping on about how such and such a mode is
superior for games when very little games software actually exists for it?
People buy computers for what software they can run on them, not what
might be possible IF people developed for it which they quite obviously
havent and show no sign of doing. HAM8 is more useful for anims and static
displays and that is the kind of software that no gamesplayers want. The
fact that you can also get bugger all games on the Falcon, but all the
best games for the Amiga, is just a bonus for us lucky A1200 owners.

>:>>NO MY FALCON DOES 1344*600 in 8bit colour

>You can add FASTRAM to a Falcon just like a A1200. W/o fastram the Falcon
>has less contention - in this particular mode you get about 20% decrease
>in memory bandwidth.

Ie. You get slowdown of program execution when you up the resolution
on a Falcon, unless you spend *even MORE* money on adding a card to your
machine which gives you fastRAM, since the machine itself has only a 16
bit CPU bus to memory. How much do these cards cost and how easy are they
to get. I`ll bet for the cost of a Falcon plus fastram card, you can
easily get a nice A1200 50Mhz, 882, RAM , SCSI-2 `combo` card system.

> Gavan (the MORON)

>(sorry couldn't resist that one again).

>owners
>have 4meg/HD and would say that this is what people will develop for.
>There
>maybe more 1200s but a smaller PERCENTAGE of the owners have FASTRAM?

At last, a true statement! A smaller precentage of A1200 will have
fastRAM than Falcon owners will have 4 megs RAM. However, what counts is
how MANY A1200 owners have it, and I confidently predict that they will
outnumber Falcons considerably.

Not that it matters, as the OS will automatically put executable code
in fastRAM unless otherwise specified, so there is no need to develop
specially for FastRAM.

>the appropriate bit for each bitplane. If you simply wrote 4 * 4 longwords
>then any bitplane data on the screen would be corrupted.

You dont need to read if you are simply blasting groups of pixels to
the screen, rather than updating individual pixels. Since most ham8 stuff
will be pre-rendered for fast play back, youll find that updating a screen
for animations will require less data to be written as each pixel takes
only 1 byte and provides four times as many colours as the 65k mode on the
Falcon. The 32 bit at a time write access of the CPU also helps here so
potentially you can update a screen four times faster, with four times
more colour at the same resoulution.

>Lack of self-esteem? what? You are the one who just wrote some completely

>Subject: You know .. ;) .. The Falcon handles both IDE and SCSI-II as
>standard .... too
>bad all "machines" don't ...

So what! SCSI devices are transparent to the user. They are just another I/O device handled by the OS. You can get an A1200 with SCSI and fastRAM for less than a `standard` Falcon, so *IF* the user wants SCSI then they can have it on the A1200.

As for handling SCSI as standard, you`ll need to obtain drivers for various devices on both the A1200 and Falcon - you cant just take ANY device and plug it in expecting the OS to recognise it. Maybe you mean the OS includes some drivers for popular devices?

>Most 1200 owners play games, they DO NOT have FastRam ..

Thats a fair point. Thats why A1200 owners enjoy a large variety of games software. Of course, serious owners can add fastRAM and SCSI and a 25Mhz 882 and enjoy all their benefits whilst still enjoying all the games, and spending less than they would on a Falcon.

Gavan

799. Press coverage of Jaguar in UK

Newsgroup: comp.sys.atari.advocacy
Date: 1994-02-21 16:14:11 UTC
From: gmoran@nyx.cs.du.edu
Message-ID: <9402211614.AA16361@nyx.cs.du.edu>
Source record: 18600

Following my comments on Ataris crap marketting being in danger of killing the Jaguar, I thought you might be interested to see what the `Edge` magazine (an upmarket UK games mag) had to say about the CES show.

Edge has always been supportive of the Jaguar hardware, and given it a lot of coverage and `til now, the benefit of the doubt. Heres what they have to say...

"Ataris stand was conveniently out of spitting distance from both Nintendo and Sega`s booths - not that either party would have had just cause to do so. Without Rebellion`s Aliens vs Predator and ATD`s Cybermorph, the Jaguar stand would have been a wasteland of Ill-concieved software. However, it was worth the trip to their stand if only to see their promotional video - an unfortunate example of the Atari marketing machine in full flow. Scratch that, full ebb."

(from Edge Magazine , march 1994)

Above the article was a picture of the Atari stand with the caption "Velvet catsuited girls, Rebellions smart Aliens vs Predator and Cybermorph were the only valid reasons to visit Atari`s stand."

Also in that issue they reviewed Raiden for the Jaguar, heres some quotes...

"In a move typical of the company, Atari have taken one step forward with the 64 bit Jaguar hardware - and two steps back in their choice of software."

"The graphics are two-dimensional and many a Commodore 64 owner would sneer at the supposed `CD quality` music."

Rating Five/10

(from Edge Magazine , march 1994)

Edge gave extensive coverage to the new machines coming from the Sega and Sony - the Saturn and the PS-X. They looked really awesome! I`m talking mindblowing here. Given the marketing muscle of these two giants, Atari would have their work cut out even if they were any good at marketing and software support, which experience has shown us they most certainly aren`t.

Yes and over 50% of 1200 owners will not have fastram, says a lot about
Amiga owners does it not?

:>>The Falcon's 030 with TTRAM outperforms the 1200's 020 with Fastram.
:> And a SUN workstation outperforms a Falcon with or without TTRAM! Thats
:>a totally meaningless statement. By the time you hoof out the moolah for a
:>TTRAM expansion for your Falcon, you could have plonked a 50Mhz 030 with
:>50Mhz 882 and lots of RAM into the trapdoor slot of the A1200. Prove that
:>the delivered CPU performance of any falcon can outdo any A1200 configured
:>at the same price level. I think you`ll find the A1200 wins out in
:>delivered power for the price EVERY time.

With SCSI II, LAN, MIDI, DSP (can u get dsp for the Amiga yet?), HD floppy,
analogue joystick ports etc etc.
I think the point you are trying so badly to convey is that the Amiga
comes with less as standard - hence it is cheaper, however if you were to
add all the Things that the Falcon has as standard it would be about the
same price, we could get into a pedantic argument like 'my computer
is 8.3% faster than yours for the same price'...
Its silly to argue price/performance because lets face it, you can get a
486/svga/170mb/4mb ram for about 900 pounds.

> mdg@ukc.ac.uk (M.D.Griffiths) writes...
:>>:>>>How many A1200 owners have FastRAM - not 99% for sure
:>>:> I`d bet a lot more A1200 have FastRAM than there are Falcon owners.
:>>:>With WELL over ten times as many sold, even if only 1/10 have it, thats
:>>:>more of a market than the Falcon.
:>
:>>The argument was about what the Base system was. Since 99.9% of Falcon
:>>owners
:>>have 4meg/HD and would say that this is what people will develop for.
:>>There
:>>maybe more 1200s but a smaller PERCENTAGE of the owners have FASTRAM?
:> At last, a true statement! A smaller precentage of A1200 will have
:>fastRAM than Falcon owners will have 4 megs RAM. However, what counts is
:>how MANY A1200 owners have it, and I confidently predict that they will
:>outnumber Falcons considerably.

Gavan we were arguing about BASE systems and you just dug yourself a big
HOLE. You just admited that more Falcon owners(99.95%) would have 4meg/hd
and not as many (prob 50%) 1200 owners have FASTRAM, so do you want to
compare base models now?

:> Not that it matters, as the OS will automatically put executable code
:>in fastRAM unless otherwise specified, so there is no need to develop
:>specially for FastRAM.

You need to be more careful when devoloping stuff that runs in Fastram
esp stuff which might be timing dependent. Gavan's stunning technical
knowledge shows through again.

:> [lots of Gavan rubbish deleted]

:>*effect* at a reduced frame rate. This sort of software manipulation isnt
:>very effective - just look at some of the pathetic attempts to do parallax
:>on the PC - even a 486 produces dodgy results. Of course you HAVE
:>actually done this to see if you can achieve 17 FPS in 320x200x dual 256
:>playfields? What are the results like - smooth games or not? Just what is
:>supposed to do the processing for the game logic while your CPU is tied up
:>*emulating* the dual playfields. And what speed have you managed to get
:>the DSP to do it at? You *HAVE* actually tried writing the DSP code to
:>back up your claims havent you ?

No Gavan you squirmy little brat, the argument was about whether you
could do this on an Amiga - the answer is NO - the miggy can only do
16 colour dual playfields. So the Falcon can provide 2 * 256 colour
playfields at a reasonable frame rate and the Amiga can't.
Yes I have written the code, why didn't you try it? The answer is
because you don't have the know how either on a CPU or DSP.

:> By the same token as you, I can do dual 512 colour playfields on my
:>A1200 using HAM8 - of course, the screen update isnt real-time leading to
:>jerky screens, but what the hell. According to you, theyre real dual
:>playfields.

It wouldn't be real dual playfields at all, since the fringing would
be noticable and each pixel could not have an individual specifiable
colour - you just lost the argument by admitting that it would be
really slow to acheive - this is not the case on the Falcon.

It doesn't matter because most software will be developed for the base-systems,
which means that the F030 software will be better than the A1200 software.

Exactly my point Daniel, people these days want these to happen in realtime,
not watch the Amiga struggle to calculate a ham8 screen.
The Amiga has the mighty accolade of being able to clear the screen more
quickly though! ;-)

again?

>|> Its funny I just an A1200 redraw 256 colour screens in 640x480 and it
>|> was about twice as slow as my Falcon in 800x608x256, (with NVDI) . I
>Scan rates? The A1200 mode you mention is about 72Hz non interlaced.

72hz... is that all, my Falcon can do it at 80hz or 100 or something
with a 50mhz external crystal. 800x608x256 uses more bandwith (I think
the refresh rate was 60hz NI, the Amiga 1200 can't even manage this
mode at this rate so go take a jump). Its funny how the Falcon can redraw
the screen quicker than a 1200 with Fastram, this is because even FASTRAM
doesn't help when the BUS is almost saturated in 640x480x256 NI.

:>
:>Lets see a 486 outperform an A4000-040 on, hmmm, say raytracing. Is that real

:>world enough for you?

Ok.. lets compare 486-DX66 vs A4000-40(25mhz?), the results would be quite similar, the PC has very good compilers, also some of the clone 486s are far better at FP than the intel one. By the arguments in this group shall we compare prices too? *yawn*.

>(and the PC was designed to compete with the VIC-20, btw)

I'll leave that sentence in, because it shows the naive attitude of this guy.

A 40Mhz 68030 mac is old technology. Even the mac low-end uses
68040LC technology (68040 without FPU). A 33Mhz 68040 is about 4x faster
than a 16Mhz falcon. And about upgrading to 68040 for falcon, that's like
buying a stock computer with a crappy monitor and then upgrading to
trinitron. You now have a crappy monitor in your garage.

Since the base Falcon has a harddrive, all Falcons have the AHDI (or better)
HD-driver .. which also handle SCSIs ...

Conclusion: Falcon owners can take any SCSI/SCSI-II, hook it up to the Falcon
and off they go ..

(A friend of mine usually brings his entire HD over when he wants to copy the
latest 2-3Mb Demos for the Falcon ... ;) ..)

Hmmm, 'real world.' That in which you must play with Excel in order to be taken seriously. :)

There is no such thing as the 'real world.' There is only our perception of it, which may or may not reflect the true reality of things (if indeed there is one). We may each define what the 'real world' is with respect to ourselves. The trick is avoiding the axe-murderers...

CB>
CB> Scan rates? The A1200 mode you mention is about 72Hz non interlaced.

Since the Falcon has a higher video-busbandwidth, and a selectable pixelclock, do you REALLY want to start that discussion again?

(Typing on my Falcon in 1024*768i*16, 103Hz, VGA-monitor)

The 256 col mode I use the most is the 1024*768i*256, 70Hz, still on my very normal VGA monitor .. :-)

The maximum scanrate I've had my monitor do was 159Hz, 640*400i*16 .... I was trying to achieve a new form of 3D on a monitor, according to some reports I got from a university in xxxxxxx ... ;) .... no luck though ... (I had to go noninterlace and then I could "only" do 100Hz ...)

I must stress that the above figures are NOT in any way the maximum values for the Falcon! I have a 5 quid used VGA monitor, OLD, which does pose some limitations .. on a brand new SVGA/MultiScan you can go WAY higher ..

Right, and I didn't see Commodore, Sega or Nintendo getting as many awards as Atari did at the CES. Not only did they get best game at CES with Tempest 2000, the got at least 2 best technology for 1993 awards and a couple others I don't remember the titles of (I guess commordore was too scared to show up at the CES........)

}
} Read a book on the Amiga Shell, it would take too long to explain, but basically
} imagine a system of passing arguments where you can specify the type of each
} argument (ie argument, switch etc.), get help on the syntax to pass to the
} command just by typing command ?, and pass arguments in any order.

Hmm - It osunds quite useful, although very similar to getopt. For example:

The following code fragment shows how you can process the arguments for a command
that can take the options a or b, as well as the option o, which requires an
argument:

```
#!/bin/sh5
set -- `getopt abo: $*`
if [ $? != 0 ]
then
echo $USAGE
exit 2
fi
for i in $*
do
case $i in
-a | -b) FLAG=$i; shift;;
-o) OARG=$2; shift 2;;
--) shift; break;;
esac
done
```

This code accepts any of the following as equivalent:

```
cmd -aoarg file file
cmd -a -o arg file file
cmd -oarg -a file file
cmd -a -oarg -- file file
```

of course, there is a C-language binding as well.
The syntax is pretty hairy, but the tcsh (or tclsh) shells do it better.

} [argument about regular expressions]
} I said filenames.

Yes, sure - egs:

```
ls *.c lists all files ending in .c
ls {m*,g*}.zoo list all files m*.zoo and g*.zoo
```

ls {1-4}.c lists files 1.c 2.c 3.c 4.c
ls ^foo/bar lists all examples of bar except in directory foo
ls x|y lists x or y or both
ls x?.c lists any files x<any one char>.c

or ls *.*~(lex|parse).[ch](^D^l1)
lists all files having a link count of one whose
names contain a dot except for lex.c, lex.h,
parse.c, and parse.h.

or I can do this on variables,aliases,history etc.

}
} How about having the REAL names sensible, and aliasing the esoteric UNIX commands?
}
The point is this isn't an issue. It's available. Personal preference is up to
the individual. I actually prefer ls to dir, because it's quicker to type. I know
unix inside out, and I like it.

}
} To recall the last command that begins with the letters you typed, press shift
} up-arrow. If youhave something like the KingCON console device (a window handler,
} it's still the original shell) you have filename completion too.

yeah, snap. Except it's just up-arrow. the [TAB] completion is standard as well.

} |>
} |> Does it spell-check commands and suggest replacements ? Even for its
} |> aliases / variables etc.
}
} No
yeah well, some people don't like it anyway.
}
} The Amiga shell has an AREXX port, do any of your shells have anything remotely
} like this?
}
Nope, just the perl language. Still, from what little I understand of arexx it
seems to me it's used as a scripting language for other applications. Since MiNT
has (t)fork(), you can just fork /bin/sh and call that. I expect arexx can do
more than that though - tell me about it.

} It has plenty to do with that. Rather than switching large segment/page tables
} around, a context switch basically involves a register swap. Not having virtual
} addressing helps a lot here. (Note that not having virtual addressing does not
} mean that memory protection is impossible. If anything, it makes it more
} lightweight.)

Hmm - I'll have to look at the source before answering this one. Get back to you.
(I was under the impression that the context-switching took minimal time.)

Simon.

AAA is not hardware compatible with AA because it would have to be a kludge to be so. HAM-8 will be in the AAA chipset, just as HAM-6 is still in the AA chipset. HAM-10 is HAM-8 with two more bitplanes. Two bits per pixel difference in a graphics mode does not make one a kuldge and the other one not a kludge. Commodore stated before the AA systems were released that AAA will not be compatible at a hardware level. This is why they did not release the AA hardware documentation. This is why they insist on using the Operating System (you know, one of those things that people who use computers as computers use, and not those so called 'KuLe DuDzE' use.) Do you really enjoy spouting all this drivel?

>etc etc etc.

I think you should compare like price with like price. For serious
use, I (and serious software developers) consider an A1200 with added
fastRAM to be the base machine. Even though the 2 meg chip only A1200 is
the cheapest machine, anyone *wanting* to run powerful software WILL have
the extra memory.

[stuff deleted]

>FASTRAM FASTRAM FASTRAM - Gavan thats your only argument, I can add >this
>to my Falcon too, and get a 32mhz 030 at the same time for about 200
>pounds.
>I'm notr trying to say that the Falcon is cheaper, you get much more >for
>your money.

The saving grace of the Falcon system is the DSP. I`m pointing out that
not many people need it, and so would be better going for a system that
delivers more processing muscle for standard computing tasks. You make a
lot of claims for what the DSP can do, but I dont see a lot of software
out there using it for things like improved FP operation, or providing
effects in games and until we see a lot of mainstream F030 software this
will continue to be the case. You can see a lot more benefit from fastRAM
for the average application, than the DSP gives.

With such a small user base were not likely to see much software
development, and without a lot of development there wont be any increase
in the user base. A vicious circle, and Atari have shown no sign of
pumping money in to break that circle. What have they done to promote
Falcon software development? They havent even advertised the machine in
the mainstream press. There is virtually no development work being done by
them on the hardware - it looks like they have left the machine to die
whilst concentrating on the Jaguar. Whats worse, they dont even seem to be

able to market a surefire winner like the Jaguar right. It looks like it could go the way of the Lynx - a technically superior machine sunk by lack of promotion and developement

>Yes and over 50% of 1200 owners will not have fastram, says a lot >about >Amiga owners does it not?

It shows that the Amiga is actually finding a practical use (ie leisure software) with a lot of people. Remember the days of the old 8 bit machines? Most people bought them to play games on and ended up learning to program them. Thats the strength of the Amiga, it has a constant influx of new blood. I wonder how many `new` Atari owners the Falcon generated? I`d say the vast majority of Falcon owners are simply ST owners who wanted the latest Atari.

>With SCSI II, LAN, MIDI, DSP (can u get dsp for the Amiga yet?), HD >floppy,
>analogue joystick ports etc etc.

Well, its not `proper` SCSI II - its a physical SCSI I port with the II command set. The LAN port implies ethernet/novell compatibility, but in fact its just a modified appletalk port with almost Zero support. MIDI costs 15 pounds for the Amiga, and most people dont need it. The Amiga DOES have analogue ports (well, only one of the ports can accept an analogue stick, but at least you can actually get games that use it) and you can get a HD floppy if you really want it - perhaps if you want a second drive you might get a HD floppy instead of a normal one. The only thing you cant get is the DSP, so if you really want one then the Falcon is the machine to have (or a AV MAC or PC with DSP+Soundcard).

>I think the point you are trying so badly to convey is that the Amiga >comes with less as standard - hence it is cheaper, however if you were >to >add all the Things that the Falcon has as standard it would be about >the >same price, we could get into a pedantic argument like 'my computer >is 8.3% faster than yours for the same price'...
>Its silly to argue price/performance because lets face it, you can get >a >486/svga/170mb/4mb ram for about 900 pounds.

Yep, thats the problem for both the Amiga and Falcon. The PC undoubtably offers the best performance for the price. You can also get a much larger range of software and hardware add-ons for the PC than you can get for anything else. It may be a bit of a bodge in very many ways , but its speed and value for money easily compensate for the technical shortcomings. I`d say that the Amiga has a year at most before its completely wiped out by the PC, the Falcon has gone already. The only reason the Amiga still has a market is because you can buy an A1200 for only 270UKP - much cheaper than any PC, and then upgrade as you can afford it. Since you are looking realistically at spending 800 UKP on a decent Falcon, I`d say that many ST owners who had the money to upgrade decided to go for a 486 instead. I`d say a lot of Amiga owners thinking of an A4000 probably opted to go the PC route too. When I come to upgrade to a more powerful machine, I`ll most likely buy a PC unless C= drastically

lower the price and improve the specs of the A4000.

Gavan

>compare base models now?

Well, leaving aside the fact that there will be more A1200s with fastRAM than there are Falcons in the world, I have to keep pointing out that you can get A1200s with FastRAM for less than the equivelent Falcon. When developers make serious software, they have a different `base` in mind than the lowest priced machine. I guess that is why you argue the Falcon `base` machine is 4 meg, despite the fact that you can buy it in a 1 meg config. So when F030 developers develop, they know that they can expect a machine with 4 meg. Similarly, when someone like ASDG does a program like ADPRO, they know that anyone who will buy it WILL have a ram expansion.

If you consider the `base` A1200 to be 2 meg chipram only because it is the cheapest, then you must accept that the `base` F030 is 1 meg RAM only. My argument is that the base machine is whatever the majority of the target market will have, and in the case of both the Falcon and A1200 for serious software this will be 4 megs plus.

>:>Not that it matters, as the OS will automatically put executable code
>:>in fastRAM unless otherwise specified, so there is no need to develop
>:>specially for FastRAM.

>You need to be more careful when devoloping stuff that runs in Fastram
>esp stuff which might be timing dependent. Gavan's stunning technical
>knowledge shows through again.

You have to be careful not to put data which the custom chips will use into fastRAM. If you are at assembly level it can be tricky, but I only ever use C and the majority of development of serious applications will be done in C. You simply tell the compiler that your code and data can use any RAM and the OS will automatically place the code and data in FastRAM if it is available.

Games developement might be a little more tricky, but I`ve seen many games that can utilise fastRAM - eg Formula 1 Grand Prix, Birds of Prey and Frontier, to make a much faster game. Arcade games tend not to benefit as they are synced to a 25 or 50Hz update rate anyway.

I`d personally like to see games that require 4 megs of RAM, some of it fast, but obviously games publishers are reluctant to put out something that cant run on all Amigas. Here, I would imagine that Falcon games

developers could assume that they could use 4 megs of RAM, but how many commercial Falcon games are there? And how many actually use all that RAM and arent just PC or Amiga conversions? The bottom line is that the Amiga has more, and better games. I`ll stick with results over unfulfilled potential.

Gavan.

Mr Sinclair has just described the Falcon, except for the 030 frequency,
which if of 16mhz, and the memory, which is limited to 14Mb.
But I'm obliged to say that he is right for the management: if Atari
had done a good job when the ST was selling well, perhaps Atari would still say
something to people in the computer area.

>>screen
>> ...

>Who cares about pre-rendered graphics?

Well, anyone wanting to do multimedia, animations, slideshows,
ray-tracing for starters.

Being faster at real time screen updating in a high-colour mode means
only one thing - games. And thats exactly the Falcons weakest point.
These high colour modes will find their main use as display buffers and
for that sort of thing the ham8 mode is superior in all departments -

colours provided:
260000 - thats 4x the 65k Falcon mode

memory/screen update requirements:
uses half the memory, and thus screen can be updated faster especially
considering A1200s wider memory access bus.

resolution:
ham8 can be done at up to 1280x512 + overscan AS STANDARD by the operating
system. More is possible by tweaking the display drivers. How high can the
65k mode go? The Falcon has 4 mhz more video bandwidth, but dont forget
that a 65k screen takes TWICE the bandwidth of an equivelent ham8 screen.

:>
:>>Who cares about pre-rendered graphics?
:>
:> Well, anyone wanting to do multimedia, animations, slideshows,
:>ray-tracing for starters.

multimedia = mpeg/jpeg/real-time gfx/sound. Sounds like Falcon to me :-)
raytracing = render in 24bit, then convert to HAM8, or TRUE Colour, which
conversion is easier ;-).
I expect the Amiga gfx used in the ITV chart show are in HAM8 (laugh) ;-).

:> Being faster at real time screen updating in a high-colour mode means
:>only one thing - games. And thats exactly the Falcons weakest point.
:> These high colour modes will find their main use as display buffers and
:>for that sort of thing the ham8 mode is superior in all departments -

so you can write games in HAM8 can you ;-).
The 1200 is slightly better at shoot-em ups/scrolly games than the Falcon
because of its h/ware sprites etc. For 3d games (the IN thing) the Falcon
is much much better.

:> colours provided:
:>260000 - thats 4x the 65k Falcon mode

260000 (not individuable choosable). The Falcons 65k mode all the pixels
can be the colour you desire. I'm not gonna start this silly argument,
they are both very good modes for displaying pictures.

:>
:> memory/screen update requirements:
:>uses half the memory, and thus screen can be updated faster especially
:>considering A1200s wider memory access bus.

Screen update is faster for block copying animations from a buffer, but
for DELTA ANIMATION, 16 bit truecolour would be quicker since no
recalculation (or blitting of recalculated sections) would be required.
Can't these Amiga heads get it into their heads that HAM8 is not FASTER,
it is not a question of BANDWIDTH, HAM8 is a lot of agro if you ask me.

:> resolution:
:>ham8 can be done at up to 1280x512 + overscan AS STANDARD by the operating
:>system. More is possible by tweaking the display drivers. How high can the
:>65k mode go? The Falcon has 4 mhz more video bandwidth, but dont forget
:>that a 65k screen takes TWICE the bandwidth of an equivelent ham8 screen.

Actually Gavan I was working on 1600x600 util for the Falcon, but Uni-work
is taking precedence - yes that 1600x600 in 65536 colours, I got 800x600
working, and the screen didn't seem to lockup when I switched pixel
clocks to allow 1600x600, so don't harp on about HAM8.

:>
:>So which assembler do you use?

TASM 3.0 for 80x86 stuff.

I've seen 'Snasm' on a friends machine,(hi Karl!), but I don't have this myself, I'm looking for a 680x0 assembler on the PC at the moment - I'll write my own routs to shove the data down the parallel port to my Falcon/Amiga. But I'm hecticly(?) busy with uni-work at the moment.

The Falcon is still $1299!!!! For $300 more I can get a multimedia power
house.

Mac LC 575
-33mhz 040
-5/160
-keyboard
-integrated trinitron display
-dual speed cdrom
-Power PC ready

Hmmm... but wouldn't the 1-meg Falcon be the base-system?

BTW, it does matter because a lot of software for the Amiga comes and
requires (or benefits immensely) from expanded machine.

Could you say Scala, Real 3D, Imagine, Caligari, Dpaint, Brilliance,
PageStrem 3, etc.?

If we get into that criteria, then the A1200 has by far better software
than the Falcon because it has sold far more (except for music).

|> compare base models now?

Easy- just check out number of sales. Want to get practical? Let's get practical, why not. The base machine is the A1200 which has sold quite a few number of times more than the Falcon...

It's simply unfair to compare an over $1,000 machine (US) vs a $370 (US) machine. Let's compare what you can have for the same price, not just the machines...

Gee, my 486DX2 Super Turbo ($2,000) is faster than your Super Nintendo ($80)

:-)

The Falcon can't either, unless you reduce the screen size. And then,
probably you get some bus contention too.

I admit it would be nice for a 2/3 rds to 1/4th screen 'cinema' interlude
though.

|> Yes I have written the code, why didn't you try it? The answer is

It is. 15 to 25 fps (theoretical) doesn't sound that fast to me (for
a scrolling type game).

Not only that Gavan, but you could actually using copper tricks do
at least 3 playfields with the sprites. This extra playfield could be
4 or 16 colors - using AGA, of course ;-)

Would be far faster than what Griff proposes.

Griff... hmmmm... you don't have to recalculate sections for delta
animation. The anim format doesn't do that. I could then ramble
about 'talking things and how you dug your grave there' but I won't.

|> Can't these Amiga heads get it into their heads that HAM8 is not FASTER,
|> it is not a question of BANDWIDTH, HAM8 is a lot of agro if you ask me.

Ham8 for delta animation is faster, and compresses more in memory.

Read my lips - I said 2 x 256 colour playfields with seperate palettes. SEPERATE palettes, you talk about sprites - aren't those the things that disappear when you start opening up decent modes on the Amiga? The slightest bit of overscan means you start losing them. Sprite playfields are nice,(I think several demos/games have used them), but lets not change the argument again. BTW you are even wrong about the being able to do 3 playfields you could probably do 4/5 (sprites are 64 wide so there is enough copper time to change a lot of pointers). I guess I'm just slagging down the Amiga again though ;-).

Devpac Amiga v3 (of course!).
didn't really like Argasm or Seka.
Snasm or PDS on the PC is many times faster even than Argasm etc.

>playfields at a reasonable frame rate and the Amiga can't.
>Yes I have written the code, why didn't you try it? The answer is
>because you don't have the know how either on a CPU or DSP.

It all started when Rickard Troedsson claimed you could do 256 colour
dual playfields in the 65k colour mode on the Falcon. He actually said at
the time that you could use the two seperate display bytes to hold the
playfields. This is obviously crap. Now you come up with a `dual
playfield` display and all it is is software calculation of what the
display would look like, and rendering the result to a 65k screen.

Now, considering that the main use of dual playfields is parallax
scrolling, Lets see what you would need to do for each update (all the
pixels will change if scrolling):

Read both of the virtual playfields: 64k each = 128k data read
Use your lookup table to find the pixel value on each pair of pixels read
Write every pixel of a 320x200 hicolour screen = 128K data written.
Thats at least 256K of data shifted for EVERY screen update.

You claim 17FPS on an 030 which works out at a throughput of 4.3 megs
of data shifted by the CPU every second. Doesnt sound very realistic does
it, considering you claimed the max amount of screen memory shifted on the
Falcon was 3 megs in mono in a previous post. Even if the CPU could shift
this, where does that leave processing of other things like collision
detection and game logic. ie This is totally unviable. What about the DSP
then.....

Now, you can actually educate me here and tell me how the DSP interacts with the rest of the Falcon system. ie. Does the DSP share the main memory space, meaning that it could actually update the screen itself, rather than passing its results back to the 030 which would do the actual update.
If the DSP could do the reading of the `virtual playfields` and updating of the screen buffer then it might work, but a 25FPS update as you claim requires a throughput of 6.25 megs a second. This is going to cause massive contention problems between the CPU and the DSP (thats even assuming you can use the DSP in this way) and so I really doubt that this is going to be any use whatsoever.

The argument was never about whether it could be done on the Amiga or not, noone ever claimed it could do it, it was just about showing that the Falcon couldnt either. I really doubt your claims to have already tried this, you have been shown up by the post you made about screen switching on various computers to be unreliable in your claims.

Gavan.

correctly, to
>get a lot of older amiga games to run on a 1200 you can set up parameters
such
>as cache off, etc. upon boot-up, so having backwards/whatever is easily
>comparable, no!?

A lot of old games run on the A1200 with absolutely NO tweaking
whatsover. You just boot them up. Some seemed to have problems with the
new AGA chips causing corrupted screens and so C= provided an option to
emulate the older ECS chips in ROM via the boot menu. This was effective
on most of the problem software. Also, the processor cache causes problems
with many demos and games copy-protection systems and so this can be
disabled too.

Many people were reporting very high levels of incompatiblity with
non-OS legal ST software on the Falcon, so it would seem that the level of
incompatibility was higher than that of the A1200. Certainly all new Amiga
games for the ECS run without any modification on the A1200 as they are
now programmed according to the official guidelines for hardware level
compatiblity.

C= won`t release the hardware specs for the A1200, as they will not be
including AGA hardware compatibility in the next AAA set. But there is a
document available in the PD called `how to code the AGA chipset` which
has a lot of useful stuff in it. It shows how there is a very high level
of hardware compatibility with ECS in the AGA chipset. Its also obvious
that C= resorted to hardware kludging in order to maintain compatibility.
I`d say that the AGA chipset is just there to tide people over until AAA
is ready. The idea seems to have been to give people enhanced
functionality (more colours, higher rez, higher refresh rates etc) whilst

maintaining compatiblity with older stuff. AGA was probably forced out of C= as a response to improved PC and Mac gfx, as well as what was then the percieved threat of the Falcon.

Karl.

|> a 640x256x4 colour TV image. The std 640x200x4col GEM desktop was
|> revolting -all that green, ugh!
I wouldn't disagree that the original GEM desktop was a bit of a pile of dingos kidneys.
I wasn't talking about display quality, I'm sure the Amiga is capable of some NI high res screens. I was more concerned about the general feel of WB. I read the manual and found some bits which were neat because they were built in but everything it offered was available in generally better and more intuiative forms with the ST via PD/commercial add-ons. Whilst I applaud CBM for putting so much in as standard, I just couldn't feel comfortable with it.

GEM allows a computer novice to use it although there is power there too if you want it. WB on the other hand struck me as requiring a certain level of understanding before it became usable. A case in point was the disk formatting, the dialogue had all sorts of options that Joe Public wouldn't immediately understand.

It may just be familiarity but WB just seemed to be a bit 'too much' ie it got in the way of what you were actually trying to achieve. For a seasoned user it may well be a joy to use but to a newbie ie me, it just felt hostile and not intuiative.

|> I`ll have to make do with my phillips 8833 until I can afford a nice
|> multisync.
I know the feeling. When I first got my Falcon I had a cm8833. I thought 'Oh shit, this is ust a more colorful ST and I've spent 900GBP on it.'. Only when I got a Multisync, NVDI (a screen accelerator) and MTOS up and running, did it start to show it's true colors (sic). Now with 968x700x16@70Hz, I have a nice display with lots of color (I can get the same res or higher at 256 colors but the frame rate drops to about 55 which does my eyes in). Software development is now a joy with my compiler running in one window, Resource editors in another, a tcsh or 2 open in other windows and the latest version of what I'm developing, running in another, all with minimal overlap of displays.

: But how you explain you can add FAST RAM, a 50Mhz 68030 w/50Mzh FPU
: on an A1200 and still cost less than a Falcon?

: Hey, why not just put a 25Mhz68030 w/ 25Mzh FPU and the price
: is significatively less than a Falcon?

: People on the Falcon must see that since the A1200 is cheaper in price,
: it's easier to buy add-ons AND THEN compare to a Falcon.

: And in the Fast Ram case, a US $200 gets you 2 Megs FAST RAM, 25Mhz 68881
: FPU. I think it's even a bit less now.

Yes, yes, yes... This is correct. But who the f**k cares? The 'only' things that matter when discussing computers (especially 'stat-of-the-art' computers, as opposed to clones), are:

1. How good is the operating system? (Is it pre-emptively multitasking, etc.) How memory-effective is it? Is it 'beautiful'?
2. Is it possible to expand the computer as much as one might want to?
3. Is it specialized in some niche, and are the programs in this field for this computer good enough to support it? If not, isn't it time somebody started producing software for it!?

It is often not useful to discuss only things like speed, price, etc. For rendering jobs, most would argue that a CM2 beats most other machines. But it is not suited for word processing, desk top publishing or business applications like spreadsheets, vector drawing, etc. For those jobs, a Mac or a PC (and most certainly even an Atari Falcon or an Amiga, not though perhaps a bit off of their main niche) are better.
If we could be more tolerant, and start viewing different computer systems for what they are - systems - I think we would come to the conclusion that an Atari Falcon is indeed not a bad machine. The same, of course, would then apply to the Archimedes or the Amiga.

What we really have to fight is all the prejudice floating around about various computer brands, like: "The Ataris can only be used for MIDI work" and "The Amigas can only be used for playing games". We know that you can make stunning things with Calamus on an unexpanded 1040ST, and you can likewise do quite some heavy stuff with, for example, Imagine 2 on a stock Amiga 1200.

So, fight for individualism against the grey clone masses and, most importantly, fight the trend pointing towards gigantic hard disks and astronomical processor performances without even the faintest improvement in speed or flexibility! Let's reincarnate the old 8-bit tradition of making programs as small as possible!

[Pathetic? Maybe so. We'll see.]

Regards, Kristofer.

Ok... maybe the 1200 with fastram can access the database of pictures/sound
20% more quickly but it will take twice as long to display the piccy!.

:> Hey, how about making a C compiler for the Falcon's DSP, afterall
:>maybe ATARI made the DSP the CPU, and the 68030SX is just there to
:>read the mouse and joystick ports...

Raist your amazing lack of knowledge comes bursting through again -
I have Gcc for the DSP, this is quite a good C compiler is it not?
:>>:Also several other compilers too, but I myself code in assembler for
:the extra speed. Please don't write such statements they make you
:look rather silly.

:>|> :> Griff... hmmmm... you don't have to recalculate sections for delta

:>|> the animation. there the delta is BIGGER.

> You have to store, you don't have to recalculate though.

Ahhh! you agree now! storing more data means more data to write, surely not?
;-) Doesn't it kill your argument that HAM8 is faster simply because it
is 8bits per pixel rather than 16 when you have to store lots more data
because it has been side-affected because of the nature of HAM8.

:>|> :> Ham8 for delta animation is faster, and compresses more in memory.
:>|>
:>|> True colour would be as fast or faster - addressing this mode is very quick,
:>|> no complex address/mask calculations needed.
:>
:> Takes more memory, that's the problem- takes more memory it should be
:>slower.

opppsss, but you just told me above that you have to store the recalculated
parts that were sideaffected by changes to surrounding pixels == more
memory if you ask me.

:>|> :>|> Actually Gavan I was working on 1600x600 util for the Falcon, but Uni-work

|> fact that you can also get bugger all games on the Falcon,
There aren't many games for the Falcon but they are available. Ishar 1&2, Transartica and 3 new ones from Atari that use the extended controllers from the Jag. There are others in the works.
Considering the number of units out there, there is a surprising amount of bits for Falcons. Memory boards, accelerator cards, samplers, video digitisers, D2D packages, art/graphics, updated WPs, telephone answering systems, screen res enhancers, PC emulator, updated languages, huge amounts of PD, NVDI and much more.

Raist, I've been hearing 35,000 for the number of Falcons sold.
Also, sales have increased dramatically since Cubase Audio was
released in the UK according to posts in the ST section. Not
that I'm making an argument that the Falcon sold anywhere near
as well as the 1200, just trying to clear things up.

You've quoted "20,000" Falcons sold since more than 6 months ... during that time sales have picked up, with the release of Cubase Audio and other quality soft.

I'd say it has to be over 35,000 , but I admit it's a guess.

I've been reading with interest the slagging match of Griff vs. 1200 owners.
I've come to the conclusion that most 1200 owners are very paranoid, they seem to thing that us Atari folk are saying, 'look your machine is shite'. I happen to think that the 1200 is very good value for money and a good step up from the a500/+. The fact is though that even a Falcon without fastram is 'better' than a 1200 with fastram. How do I define 'better'? Well, it's simply got a lot more hardware under the cover, but then again you pay a hell of alot more for it.... This is the way things go in life.

... Also alot of 1200 owners like to go on about how crap Atari is at supporting their machines etc. All I can say to that is, 'Really? Ooooh we never noticed before, thanx for telling us....' BTW that last sentence was sarcastic :-)

OK so the 1200(with fastram) might be able to write to memory faster than a Falcon(without fastram), but does that make it overall a better computer?? I just would love to hear one 1200 owner write, 'OK, the falcon's better than the 1200, but I decided to get a 1200 coz I had a Amiga before and it was good value for money'. That's a fair comment, and that's why many St owner but Falcons, coz that's what they're used to. OK, they're used to Atari's quirky little ways, but this is what makes Atari machines s

o 'interesting'. You have to really delve deep into the hardware to find all the little secrets(just look at some of the stuff that was done on the ST)..See thing is all you 1200 owners, the Amiga market is very BIG, and in a way this has spoiled things, OK you get a lot more software, but sometimes it seems there's just too much to keep track of. The Falcon is the complete opposite, there's not enough software, but for coders like me (and Griff (who happens to be an excelent coder(to all those who keep sa

ying he's wrong)) will find the Falcon far more interesting, and if there's something we want we can probably write it and it will benefit other Falcon users, which is a nice feeling. Owning a Falcon is like being a memeber of an exclusive London Club.....

BTW I don't actually own a Falcon yet but I intend to get one, and a 1200 too!

I'm sure I'll get slagged by Moran or Brown for this, but I think I make sense, OK?

Alan. (se1ap@dmu.ac.uk)

Source record: 18545

I have got an A1200 (you could slag me off for that) but :

HAM8 is shit for programming games/demos with, it is only useful for still pictures, and then only if they are good quality.

You cannot have 2, 512 colour pictures in HAM8 without fringing because HAM8 works by modifying the previous colour - it takes two steps to get from say white to blank, thus causing fringing.

Now, with regard to the 1200 and Falcon debate!! (slagging match)

Both of the computers are better than the other in some aspects

eg the A1200 with it's 24bit palette, and the Falcon with it's DSP

I don't think that it is fair for people to slag other computers off, even when most of the people slagging of the Falcon won't have seen one, let alone used one.

I have used a Falcon for about half an hour (I don't think I am an expert on the subject) and from what I saw that worked with the VGA monitor it was very good (What's this, an Amiga owner saying that an Atari is good, oh no he must be shot, go on I don't care). If it had been linked up to a Multisync (You need one of those to get the best out of the A1200 as well) then I'm sure a lot more of the software that Alan (se1ap@dmu.ac.uk) and I tried on it would have run.

Please stop slagging each others computers off, they are both as good as each other in their own respects.

I was actually going to buy a Falcon (after my Amiga 500) but the price was just too much for me so I bought a 1200, I am happy with my purchase, but I would have been happy if I had bought a Falcon)

I have never owned an Atari, so why do I say that a Falcon is good??
Because it is, on paper it is a lot better than the 1200, in reality the A1200 has been more popular so people have learnt more about it, but in time I think that the Falcon will catch up, and then leave the 1200 for dead when it comes to demo's and sound.

>Tempest 2000, the got at least 2 best technology for 1993 awards and a
>couple others I don't remember the titles of (I guess commordore was >too
>scared to show up at the CES........)

I was illustrating how Atari is cocking up the Jaguar marketing, not
trying to make a C= vs Atari point. I frankly couldnt care what C= did or
didnt do at it. Just look at how Atari have (mis)marketted past machines
and ask yourself `is the Jaguar a surefire bet for my money?` before
urging people to buy one.

Yep, thats what sank the Falcon - it was just too expensive to upgrade
to and if you had the money a 486PC looked a better bet for many. Thats
where the A1200 scores by not being as well specified initially, but could
be updgraded as the user could afford it.

1600x600x655365 colours = 1.83 MBytes per screen update.

You are talking about 91 MBytes sec for just 50Hz update, or as much as
128Mbytes second for a stable 70Hz screen. I really doubt the Falcon has
that much video bandwidth AT ALL, never mind that it could do it with only
25% contention to the CPU.

16
>GM> bit CPU bus to memory. How much do these cards cost and how easy are
they
>GM> to get. I`ll bet for the cost of a Falcon plus fastram card, you can
>GM> easily get a nice A1200 50Mhz, 882, RAM , SCSI-2 `combo` card system.

>Falcon030, 4Mb RAM, 85Mb HD: 9995 SEK
>Eagle Sonic TT-Ram expansion card: 700SEK

How much RAM is on this TT-RAM card? You dont mention ANY amount at
all, which makes it sort of useless.

>Total: 10695 SEK

>A1200, 2Mb RAM, 80Mb HD: 6895 SEK
>+ 2Mb RAM: 1200 SEK

>Total: 8095 SEK

Thats an incredibly cheap Falcon setup an an incredibly expensive A1200
setup. maybe thats the way it is in Sweden, but not it would seem in the
rest of Europe or the US. Then again, prices are really high in Sweden
generally.

>That leaves 2600 SEK for the SCSI-II, DSP, 16bit sound (oops), 030 etc ...

>FORGET IT!

>(2600 minus Swedish V.A.T = 2080:, which is $260)

I`ll have to accept your figures for Sweden (even though they sound a
little unrealistic), but please clarify if the TTRAM card actually has
any RAM on it, and how much an A1200 with 80Meg HD and a
GVP-SCSI-RAM-882FP card would cost if you have the figures. Here, you can
get an A1200 with 2 megs chip, 4 megs fast, SCSI controller, 80 Meg IDE
HD, 25MHz 882FPU and MIDI ports for only a fiver more than a Falcon 4/65
machine.

How much do these setups cost in the US?

Gavan.

You label it as much memory. However, I wonder 'how much memory' is that
vs 16-bit display.

|> I'm sure you all know the A1200 was released because Commodore crapped
|> their pants at the sight and sound of the Falcon.

Absolutely not. The A1200 was designed way before the Falcon came out.
They feared Clones and Macs though...

|> So they released a
|> rushed version of their new chipset (half finished) to try and cut off
|> the sales. Which it didn't as those who wanted a Falcon got one and those
|> who didn't didn't.

About cutting sales.... hmmmm... I wonder why the Falcon has sold
sooo much then.

|> Same with the Jaguar, which is quite a spectacular machine and the CD32
|> which is just a basic non upgradeable (bar FMV) A1,200 which is only just
|> ahead of the Nintendo/Sega current machines.

My my my... Get this: to do such a thing will require a bit of
intelligence. C= regarding management, has almost none (but same with
Atari). The reason they did the CD32 is because someone had it as
an idea and then someone high up there liked it because it will get the
company money. That's all there is.

|>
|> Also how can people just knock Ataris financial position when Commodork
|> are in the same if not worse position.

C= is not in the same position. Atari reported in their last report
that they lost 17-18 million dollars. Net sales of 4.4 million dollars?
That's a fraction of C='s.

And C= finally got steady... we'll have to see what happens to the next
ATARI report...

From the Jaguar mailing list, ATARI is looking now for support for
investors, so they can start advertising the Jaguar as they wanted +
the national rollout they wanted.

That doesn't sound like they have a lot of money...

Please, don't take is as a flame, I like the Jaguar too, but let's
say that we need to do a reality check here.

|> They had to lower the price of the
|> A1200 by a hundres quid just to shift some boxes and get some turnover.
|> Why wasn't CD32 originally planned for USA ??

Because C='s super-big market is in Europe, particularly UK and Germany.

Why release a machine where you are not famous? You release it where
you are well known first.

|>
|> The Jaguar will make piles of cash in the states and then will get the rest
|> of the world from there ...
|> With Commodore doing badly both in the States and Europe (bar the A1,200)
|> then whose looking good ????

The CD32 is doing awesome in Europe, same with the A1200.

The A4000 right now, even with its price, its in more demand that C=
can cope with because of the videotoaster.

If ATARI makes enough cash with the Jaguar, that's a thing that is still
up in the air. The Jaguar looks awesome, but unless ATARI gets the number
of units they planned to get....

|>
|> What do you want to know? ;-)

I would like to know more about texture mapping and polygon rendering.
I with a friend of mine came up with a texture mapping algorithm recently,
but would like to optmize it, now if it really works ;-), and see
other possible ways to do it.

|>
|> :>|> goes with your age. (ooopsss sorry, slagging you down again, its a
|> :>|> compulsion I have - guess I better see a shrink ;-)).
|> :> YEP!

Not actually. Lating american- I am from Puerto Rico (and now I am here
again), although we get some American influence here (well, I think everybody
does :-(:-)).

|> You obviously don't understand my sense of humour, opppps

Probably not. Just use ';-)' and I'll get it :-)

|> sorry I'm being English and superior now (something in common with Chris
|> now!).

he he. Well, that would be much better, if all this 'fight' was a lack
of inter-culture communication. I got the one about the shrink though...
but maybe I probably agree with the joke... :-)

|>
|> Read my lips - I said 2 x 256 colour playfields with seperate palettes.
|> SEPERATE palettes, you talk about sprites - aren't those the things that
|> disappear when you start opening up decent modes on the Amiga?

He he... they won't dissapear in 320x200. I am not sure, but I think
they won't either in 640x400 as long as it is interlaced and not double-ntsc.

|> The
|> slightest bit of overscan means you start losing them.

Why, I mean, it is a bandwitdh problem, and AGA supplies quite a bit
of bandwidth compared to before...

My idea about sprite playfields is that you wouldn't have to make
calculations, but that it will be fast. If you use sprites on AGA too,
the palettes will be separate from those of the screen (you can choose
the 16-color palette sprite bank from the 256 color registers).

|> Sprite playfields
|> are nice,(I think several demos/games have used them), but lets not
|> change the argument again. BTW you are even wrong about the being able to
|> do 3 playfields you could probably do 4/5 (sprites are 64 wide so there
|> is enough copper time to change a lot of pointers).

I guess I don't understand your comment here. I mean, if you have
enough copper time, that's precisely why you should be able to do it.

|>I guess I'm just
|> slagging down the Amiga again though ;-).

He he...

Sad reply, ever programmed sound stuff on the DSP? obviously not judging by
your reply, 4 channel interpolated sound (24bit volume,48 linear interpolation) takes
about 8% DSP time. Kind of makes you look silly again. Please do not
make sweeping statements which you cannot back up.

The secret to all 'realistic' types of modelling like gouraud,phong
and tmapping is interpolation, most 'tmapping' is not true texture mapping
it is more of an approximation, since proper texture mapping needs to
take perspective into account which is expensive in terms of cpu usage.
Most 'texture mapping' simply 'squashes' a texture onto a polygon.

20k/vbl (1meg/s) by SOUND DMA.
60k/vbl (3meg/s) via the HOST PORT.

you can use both at once, the SOUNDDMA is literally free, it doesn't seem
to add to contention at all (hardwired perhaps?)

DSP has 32kwords of 0 wait state ram,
can transfer something 48 meg/s or 96 meg/s from on-chip ram.
(thats 2 24 bit reads every 2 cycles at 32mhz.)

The DSP does not have access to CPU memory, it is not designed for this
really anyway, its address space is only 65kwords in X,Y,P memory.

:>Well done Gavan, maybe Griff has made a mistake, but not NEARLY as many as you lot have
whilst Griff kicks your ass.... ;-)
:>You must be having a real buzz now Gavan, eh?

the key word here is VGA hardware specs. VGA is a very old standard, but
a standard it is, there are lots of video cards out there capable of far
more than any Amiga or Falcon, (including 5x faster bitblitters on these
Cards). I can post some docs for my PCs video card if you really want,
but it gets a bit tiresome with me posting all the source and h/ware
FACTS all the time.

As for Gavan, gloating over someone who he thought had corrected me, it
kind of says alot about him, because he can't actually acheive this
himself.

Griffy (I hate OUT and ES and DS , blah blah blah!)

Oh please, multimedia? An Atari 2600 can do
multi(more than one)media. A newspaper is multimedia (written
words and photographs). I hate that word. Please explain what
you mean by multimedia. The only definition I've seen of
"electronic multimedia" was in Engineering Times and required
a moderate to high end workstation.

It's been a while since I used my Amiga, and even then, I have an
Amiga 1000 running Workbench 1.2 or 1.3. My question is, is the
toolbar at the bottom of your screen part of Workbench, or an add-on?

Thanks!

Ren

PS: Nice looking desktop!

You can add things like a 50Mhz accelerator and still be cheaper than
the Falcon.

Griff, I thought we were starting to get past this shit. Get a shrink, please.

BTW, 8% takes a bit of time right? is like 25 fps goes down to 22 frames
or so... (with 4 channels of sound).

Question: how then are you supposed to do the 25fps with the 256
dualplayfield mode?

No flames... so the DSP in the Falcon can't access the other RAM
directly.... Is like having a chip with 'a big cache' and the 68030
as an interface to the real memory... :-)

Well, the little problem is that the "small" market of people that love
3d graphics video, and multimedia stuff probably won't agree with you.
Presenting a Ham8 screen or animation is not a problem at all.

Sorry but Devpac is my preferred Falcon/Amiga assembler, its relatively bug-free and updated regularly. I also use a very good assembler on the Falcon called Turbo-assembler (this does 1,000,000 lines per minute but does not have macros :( ).

:>>didn't really like Argasm or Seka.
:>What was wrong with ArgAsm? (Long dead btw.)

it doesn't assemble to memory, only to disk... which is rather annoying.

:>>Snasm or PDS on the PC is many times faster even than Argasm etc.
:>Give us some numbers then: lines/minute, time to assemble a an xxx lines
:>big file with yyy output size.

I don't have Snasm or PDS, I have only seen them, but they looked faster and more powerful (esp. macro wise) than the ST/AMIGA equivalents. Perhaps someone who uses one of these two could comment.

'pre-rendered multimeda animation'. ok?
where did I mention HAM8?
for real-time stuff the Falcon is better (real-time == generate on the fly).

> Griff, I thought we were starting to get past this shit. Get a shrink, please.

sorry I'm not American ;-). (bitchy huh?!!! (sorry))
I'll be less patronising to you in future.

> BTW, 8% takes a bit of time right? is like 25 fps goes down to 22 frames
>or so... (with 4 channels of sound).

pro-tracker on an a500 takes 9-13% (or more?) , so the same goes for the
Amiga, the Falcon can sequence and calculate music in parallel.
yawn

25fps using the CPU, because in general doing the table lookup
gets a lot of cache hits (because of blank spots on the screen etc), however
the worst case is 17fps, u can get about 25 using the dsp too, but it is
waste, since most of its time is spent waiting on the transfer.

yes I totally agree, but lets not bend the meaning of 'realtime' multimedia
- you are talking about pre-rendered presentations. For realtime stuff
true is better.

assembling to memory is that vital bit faster ;-).

obviously if you are remotely debugging then it is more practical to assemble
to disk and upload the file to the host machine, but I guess with me its
just a throwback of when I had no Hard-drive on my STFM back in the good
old days ;-). (assembling to disk would be soooo slloowww!).

So where are all the Atari Mint/Multi-Tos, etc, ec interfaces?

Last time I looked at an Atari ST, it was running some Mac-a-like interface, but had really awful colour scheme. About as bad as the orange and blue scheme on AmigaDOS 1.3, but using greens instead.

- Jim

942. So what does the Acorn GUI look like?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-02-26 04:12:38 UTC

I've heard lots of geeze, AmigaDOS looks ugly, Acorn has a much nicer GUI.

How about posting a few GIFS of the out of the box Archimedes desktop? Also a spruced up one would be nice, with various windows open, menus being pulled/popped down?

CP Brown has posted his in amiga.advocacy, if anybody wants to have a look at the current AmigaDOS desktop (well, most people have it, even though it's third-party).

Personally, I don't think that the GUI on the Arch looks any more prettier
than any other one I have seen - but it has one attraction - it is
blazingly fast. I have seen things done on an Arch with 4mb ram that cannot
be done on a 468dx/66 with 16mb ram. IMHO the Arch is a far better machine
than any 486 can ever hope to be. However, Acorn marketing folks are a bit
wierd with their marketing strategy, and the machine will probably never be
more than a niche one.

That's the PD program tool manager, which does all sorts of cool things, icon docks being just one of them. I modelled the dock at the bottom on the Archimedes' computers icon bar, which is a similar idea and quite neat.

>of software that is going to benefit is games (of which there is a notable
>absence of the F030), so where does that leave the Falcon for computing?

I think the original argument was referring to fastramless machines,
which there are probably quite a few of out there... but obviously if
you run any kind of processing hungry apps you will have fastram. As
for the Falcon, what are you trying to say? If I get a TT-RAM type
upgrade, I get all of tyhe benefits you mentioned above. If I do not,
I can still run everything, just a bit slower.

>>Yeah.. sure it will run faster from FASTRAM, if I run stuff from TTRAM on
>>my Falcon it will run faster than an 1200 with FASTRAM. ok? Would you
>>like me to give you some lessons on sarcasm? You are really bad at it!

>computer buying public have spoken.

The main problem for the Falcon is twofold - Atari has not advertised
it fairly well, and they have restricted the sale of Falcons such that
you had to seek permission from Atari to byuy by mail order!!! I
think there would be a lot more Falcons running around (though still
up to a1200 sales probably) if they had not made that foolish choice.
When you try to say the a1200 sold more becoase of expandibility, you
are just plain wrong.

>

There are more games than I can afford to buy - but then, I've
forgotten - you don't include any of the 70-80% of ST games that work
on the Falcon, do you?

>
>>your rantings make me laugh, you have such weak arguments. FASTRAM FASTRAM

The only argument in favor is the lower price - but there are many
other features I like about my Falcon, some of which cannot even be
had on the a1200.

> Go on, compare ANY like-priced Falcon and A1200 setup and see how much

Price isn't everything, though it matters to the mass market.

Nope - tehre is a difference between the lowest system you can buy,
and the "base" system. I can get a 486 motherboard with no case, ram,
HD, or PS - is that the "base" pc config?

>
> BTW, it does matter because a lot of software for the Amiga comes and

I don't know about that - I'd say Calamus has also done really well on
the ST, better than PGS (which I also use on my Falcon, and would like
a v3 for...)

But I also don't think that sales mean anything about software
quality. The best terminal program on the face of the earth today is
Connect. Also, there are some very professional equivilents to most
of the software you have mentioned above... about the only thing I
would say there is a real lead on is video-type software.

IT'S A CONVERSION IT'S A CONVERSION.

Of course it could have looked better. That's becouse it's an almost exact replica of the arcade game, and the best version done so far!!!!

Raiden is a LOT of fun to play, and is one of the major influences in my early purchase of the Jaguar. It's a lot of fun to play two players, or just one...

Also, the music is EXACTLY like the arcade version. That is what I wanted... that is wht I got. And it does soud really good in stereo...

Now theres a good laugh - middle next year before the US even sees the Saturn, and .advocacy groups will be sweetness and light by the time PS-X comes into being (they were looking at a 300,000 SGI machine displaying pre-rendered graphics...)

Geez, quoting game mags - really!

Indeed, in what way were you showing how Atari had "cocked up" the
marketing? They had a large booth next to the big players, and they
won a number of awards at the show... The only thing they could have
done better was have more games on line, but that is a seperate
matter. I believe they start TV adverts soon in the top ten US
markets, and the machines start rooling out then. The article was
really only critical (and rightly so) of the low number of games on
hand. That is the only basis they gave for their claim of "ebbing"
Atari marketing.

Recently, Atari has dropped the mail-order restriction. You can now order from any mail order dealer you like... The only restriction is that the dealer has to adverstise the Falcon at list price in all ads. You never know what they might throw in extra in a combo package, though...

Just another example of Atari waking up and smelling the napalm.

It's also excellent for delta frame animations, not just pictures.
Also for painting, as long as the program keeps an internal 24-bit representation,
like Brilliance.

|>
|> You cannot have 2, 512 colour pictures in HAM8 without fringing because
|> HAM8 works by modifying the previous colour - it takes two steps to get
|> from say white to blank, thus causing fringing.

That is not necesarily true. If you have 512 color pictures, a good
Ham8 renderer (like ImageFX, Render 24, AdPro, even Dpaint IV) will try
to make colors by making a delta in the color before. It's when this
approximation is not accurate than the program 'decides' to choose
one of the base 64 colors.

to thing that us Atari folk are saying, 'look your machine is shite'. I happen to
think that the 1200 is very good value for money and a good step up from the a500/+.
The fact |> is though that even a Falcon without fastram is 'better' than a 1200
with fastram.

That above is very subjective.

How do I define 'better'? Well, it's simply got a lot more hardware
under the cover, but then again you pay a hell of alot more for it.... This is the
way things go in

Again it all depends. A Cray I should be better than al microcomputers
together (almost ;-)), but how much do you pay for it?

|>
|> ... Also alot of 1200 owners like to go on about how crap Atari is at
supporting their machines etc. All I can say to that is, 'Really? Ooooh
we never noticed before, thanx for telling us....' BTW that last sentence
was sarcastic :-)

He he he.... ;-)

|>
|> OK so the 1200(with fastram) might be able to write to memory faster
than a Falcon(without fastram), but does that make it overall a better
computer??

It all depends for what you want to use it. The thing to remember though,
is that by the time you buy a Falcon, you have an A1200 with a 50Mhz '030,
FPU and fast ram.

I still think it all depends on what you want. For music, I would say
absolutely a Falcon.

I just would love to hear one 1200 owner write, 'OK, the falcon's
better than the 1200, but I decided to|> get a 1200 coz I had a Amiga before
and it was good value for money'.

Problem is though, that the A1200 is indeed better than the Falcon at
some things. But of course, this is all relative...

That's a fair comment, and that's why many
St owner but Falcons, coz that's what they're used to. OK, they're used to
Atari's quirky little ways, but this is what makes Atari mach
|>

|> o 'interesting'.

When I had ATARI's and I was thining about buying an ST I wished ATARI
for being different... one of the resons I jumped to an Amiga. C= isn't
that much different though :-(:-)

You have to really delve deep into the hardware to find al
l the little secrets(just look at some of the stuff that was done on the ST)..See
thing is all you 1200 owners, the Amiga market is very BIG, and in a way this has
spoiled things, |> OK you get a lot more software, but sometimes it seems there's
just too much to keep track of.

Alan, sorry to disagree with you so strongly here, but this is indeed
a very lame reason. I mean, seriously though, it's way better when you
computer has a lot of software support for it. You can sit with a computer X
running demos all day if you want, but if there's no software support for it...
I wish the Amiga had things like Word, AmiPro and others, but fortunately
my needs are satisfied by powerfull Amiga software, and my requirements for
publishing are not huge. If they were, I'll probably would have chosen a PC or
Mac (Uggh! ;-)).

The Falcon is the complete opposite, there's not
enough software, but for coders like me (and Griff (who happens to be an excelent
coder(to all those who k
|>
|> ying he's wrong)) will find the Falcon far more interesting,
and if there's something we want we can probably write it and i
t will benefit other Falcon users, which is a nice feeling. Owning
a Falcon is like being a memeber of an exclusive London Club....|> .

Well, then write some applications for it! ;-) I know this '
'hacker feeling.' If I didn't had that, I would have bought
a PC. I just got mega-fed up by ATARI a long time ago.

|>
|> BTW I don't actually own a Falcon yet but I intend to get one, and
a 1200 too!

Good :-) (just kidding)

|>
|> I'm sure I'll get slagged by Moran or Brown for this, but I think I make
sense, OK?

It makes sense Alan.

|>
|> Alan. (se1ap@dmu.ac.uk)

>An A1200 can run Workbench as fast and MUCH more efficiently
>than Windows on a 486.

Thats complete bollox, you have a really naive common amiga/atari owner
view of windows, i only have a 486sx-25, it runs 800x600 about as fast
as my falcon (mainly because of its 8mhz isa bus), however with a local
bus machine it is about 2 to 3 times faster, since my falcon draws the
screen loads faster than workbench then a pc will crap on an a1200.
I'm sorry but have you seen any PCs lately? About 3 months ago I had this
'windows' is crap idea too, admittedly it does not take true advantage
of the full power of a 486 but don't think your little 1200 can do
better.

>PS. Did you know that moving the mouse around the screen really fast on a PC
>can snatch up to 30% of the processor time? That's what my Computer Graphics
>Lecturer said - I confirmed it on my Friends 386DX-33.

30% on a DX-33, it takes about 15% on a Falcon? why is this then?
mainly because on these two machines the mouse reports are relative so
the more you move the mouse the more interrupts that are generated.
This allows for high resolution devices - the amiga on the other hand
polls the mouse/joystick (you need to do it twice per frame to handle
reasonable resolution mice) - hence move the mouse a lot and you don't
get the same interrupt loading problem. The Amiga would have exactly
the same problem if it used interrupts with the mouse. (BTW you can
report mouse positions in either absolute or relative mode on the falcon,
can the same be said of the amiga?).

The actual drawing of the mouse is trivial compared to the overhead
of the device driver interupts.

You can slag down the archiac architecture of the PC ,blah blah blah
but it does most stuff far faster than the Amiga even with its custom
chips.

With Turbo-asm on a Falcon it takes about 3 seconds to assemble (so this assembler assembles as quickly on a 16mhz 030 as yours on a 25mhz 040!!) It also takes only 4 seconds on an STE (8mhz 68000!), because about 90% of the assembly time is reading the include files (about 50 files totaling about 300k). Thats Turbo-asm for you, shame it doesn't do macros otherwise it would be the only choice..

It prolly precompiles it during loading...some ST assemblers do that.
I don't like that feature.
Well..as it looks the basm test wasn't done with precompiled includes
and only with cached includes so it could be faster.
I *seriously* doub that an assembler on a 030/16Mhz/16Bitram can be
faster with normal parsing....with tokenizing(sp?) it could be
possible but this concept makes only sense in enviroments and not
in seperate programs(Editor,Assembler,Debugger,Make).

My contact at Silicon graphics has told me the Falcon was doing suprisingly well. I pushed him to be precise, after much umming and ahhing he said they were selling at about (drum roll) 10 a week.

I almost fell over laughing---that is not `well' at all. However, he then pointed out to me that just three months ago they were selling just 3 a week, if that.

He also told me that he had been specifically told to `gen up' on the Falcon as they were going to have (gasp) display machines.

Most impressive.

Which reminds me, he asked me to FTP him some good demos, anyone got ant suggestions?

Xavier.

Turbo-asm stores the assembler file pre-assembled with the actual
object code embedded. Each line is assembled as you type it, hence
the 'assembly' process only has to deal with relocation,symbols etc.

Well, I rang system solutions yesterday (Saturday), and asked them about the "afterburner" '040 board. He said they were looking at 3 different '040 boards for the Falcon at the moment (!)

I mentioned price, and he said that wasn't decided, but then I said "Well, MAC '040 boards are around #1500 aren't they", and he said it oughtn't be that much for the board. (He said he liked the easy way you can upgrade the processor in the Falcon as well. Strange, I thought it was difficult, esp. since an '040 *must* be on a 32-bit bus...)

Oh yes, he mentioned that one of the boards was based around the Medusa system...

Still, Falcon/210Mb HD/32MHz 040/SVGA monitor/Blow-Up ought to cost around #2300 all in (assuming '040 costs around #1000). Better deal than the Amiga '040 at any rate :-)

Simon.

As i assumed...well you can't compare this method to real assemblers
and imho it's not useful for big projects and i don't wanna be forced
to use another editor. Besides the other limitations...lacking powerful
Macro support.

Remember Simon that probably what they'll do is what other people
have done in the Amiga. Put some memory directly accesible in the
expansion for the '040 and then some logic to access the other
memory stuff... Although it slows down accesing the internal Falcon
stuff, it will still be really fast.

Yeah, I expected that, what I meant was that the '030 has only 16 data lines to it, so presumably they'll have to bridge from the co-pro slot (not a problem, I suppose), but this doesn't reall make for "an easy processor upgrade" ...)

The other Falcon memory will be still @16MHz anyway, I expect, so that'll be slow as .... but like you say, I'd expect the thing to go like greased lightning, compared to my 8MHz STe :-)))))

Ok...let's assume i have a project with a lot includes and
that stuff..if you change some files disk your assembler
has to update everything...te whole concept makes only sense
if you use 1 source and edit it top down.

Well...the editor is prolly one of the most subjective issues after
machine and OS:-B. Any system that forces somebody not to use your
favourite editor is imho worthless.

>I think a one-pass 'back-patching' assembler would be the fastest 'proper'

[example deleted]

Ok, here's an example of a command temlate to show what I mean:

You can get the template for an AmigaDOS command by typing the command name, followed by a question mark, it then goes into interactive mode. The template for copy is something like:

Copy FROM/A,TO/A,ALL/S,CLONE/S,QUIET/S
there are probably other options, but I'm not near my Amiga at the moment (using a UNIX workstation in the Lab), but this will suffice for my example. The following all do the same thing.

Copy df0:#? df1: all

Copy from df0:#? to df1: all

Copy all to df1: from df0:#?

Copy all from=df0:#? to=df1:

etc.

The #? is a regexp pattern match, btw. # means the following pattern repeated any number of times, ? is any character. Equivalent to the grep regexp .*

Other symbols used in pattern matching:

? any character

zero or more of the following pattern

| either pattern (eg a|b matches a or b)

(pattern) makes the pattern between the brackets behave as if it were one pattern, eg a#(bc)d matches ad, abcd, abcbcd, but not abd.

[a-b] matches anything in the range a to b (eg [0-9] matches 1,2,3,4,5,6,7,8 or 9)

~ inverts the following pattern, eg ~((foo)|(bar)) matches all files apart
from foo and bar.

There are a couple more, but those are the ones used most of the time.

|> } The Amiga shell has an AREXX port, do any of your shells have anything remotely
|> } like this?
|> }
|> Nope, just the perl language. Still, from what little I understand of arexx it
|> seems to me it's used as a scripting language for other applications. Since MiNT
|> has (t)fork(), you can just fork /bin/sh and call that. I expect arexx can do
|> more than that though - tell me about it.

Um, I probably won't explain this brilliantly, since I don't profess to be an
Arexx expert, but here goes:

Arexx programs are executed by sending the program to the Arexx port of the Arexx
interpreter. You don't necessarilly have to wait for the command to finish, so
you can fork off another thread by using the interpreters Arexx port. You can
talk to the shell in a similar way, only instead of sending Arexx commands to the
Arexx interpreter, you send shell commands to the shell's port.
That explanation is a bit dodgy, and if you want a better one, ask and I'll go
and fetch my manual :-)

Quite, the difference, hence a delta animation is one where you store the pixels that have changed between frames, and update only those.

|>
|> And once again: BOBs are NO SPRITES!!!!!!!!

Not quite. They aren't hardware sprites (those are MOB's, and we have 8 64 pixel wide MOB's). BOB's are software sprites.

Actualy, the lowest 040 board in the Mac market is from Mobius Technologies.
25mhz with out FPU is $399 and with fpu is $499
33mhz with out fpu is $499 and with fpu is $799

Than again, you can get a new(!) Quadra 605 4/80 with KB for $900

On March 14 Apple will intro and sell their PDS Power PC upgrade for $699 that blows away the 040 boards.

Indeed it does.

:>Peter Sinclair-Day
:>University of Northern Iowa
:>Cedar Falls, Iowa USA
:>Commodore Amiga and Atari Corp will be crushed by the Power PC!!

While the Power PC indeed has a lot of power, it is marketed by Apple,
REAL computer users (i.e. Unix/real OS users) do not like Apple, because
like it or not Apple computers are for stupid people !! U can say what
you like to this, but real users find the apple GUI gets in the way
of what they want to achieve. (Sorry to make such generalistions but
its true).

It will sell well though, I'm glad too, because the processor architecture
is very good - a giant leap for PC kind..... (all it needs now is a decent
OS!)

>(thats 2 24 bit reads every 2 cycles at 32mhz.)

>The DSP does not have access to CPU memory, it is not designed for this
>really anyway, its address space is only 65kwords in X,Y,P memory.

Right, so lets get this clear. The CPU must pass data to the DSP via the HOST PORT which has a 3meg/s bandwidth. So how on earth do you propose to xfer the 6.25 Meg/s needed for your 25FPS `256colour dual playfield` claim?

You have the CPU reading/writing 6.25Megs/s to/from memory AND then passing that data on to the DSP through a bus. And you said that you had already written the code to do it - you really have no credibility!!

Could this be yet another case of you making something up just coz you cant admit you are WRONG!?

Just look at the case you have cited. Not only do you make claims that exceed the capacity of the host port, but you also exceed the capacity of the CPU for data throughput. Furthermore, all your method involved was reading/writing memory and doing a simple lookup - virtually no processing. Yet you still had to throw in a line saying how the DSP would speed it up blah blah when in this case its precisely the sort of thing that WOULDNT be sped up by the DSP - the limit is CPU memory accessing and it requires MORE of this is you use the DSP. I cant beleive you claim to have already coded such a routine, unless you mean something like 100x50 pixels playfields.

Since you always cite the DSP as bumping up the performance, perhaps you can also explain what happens if you have two programs using the DSP

for different things. eg. one wants to decompress a JPEG and the other want to do your dodgy sounding floating point multiply routine. Is there a part of the OS which lets you manage program/data memory space within the DSP and how do you deal with pre-emptive multitasking - does the OS interrupt a program running in the DSP , execute your new code and then return to the other program? I doubt it somehow - the DSP is a **LOT** less useful for general computing than you make out. It is a very effective processor of digital signals (as the name implies) but for general purpose computing on a pre-emptive mulititasking OS its very ineffective.

>Griff

>packed! This means that you cannot store them pre-rendered!

Most comercial multimedia apps are distributed now on CD-ROM, which is easy on the Amiga since you have a nice cheap multimedia console in the form of the CD32 to run them on. Here, you dont need to JPEG fgx since even a hi-res ham8 pic will take around 256k with no IFF compression and you have 650 megs plus on CD. Thats pre-rendered.

Of course if you were making a MM app to be played on a Falcon, chances are it would have to fit into a relatively cramped hard disk space, so here JPEG makes sense. Strange how I`ve never seen the Falcon being used for such a thing. Where is that Falcon MM software to compete with Scala/Infochannel, MediaPoint, AmigaVision, CanDO, VideoStage Pro, Helm or HyperBook?

Oh dear, I`ve been happy to disprove your claims about dual playfields
and hi-res screens and all your crap about the DSP being better for
everything. You come out with something like your 256 dual playfields
since you are so desperate to make the Falcon look good, but you dont
spend any time thinking about whether it is possible given the
limitiations of the bus widths etc. Even though using a LUT to do 256DP on
a 65k screen sounded feasible, a little thought soon reveals it to be
impossible in anything but an incredibly low resoulution. Didnt stop you
from claiming you had already done it though.
In fact, any time someone educates you you simply claim you have done it
since you know they probably wont have had access to the Falcon hardware
to try it themselves - Pathetic! The `Dual 256 colour playfields` and
1600x600 65k colour screens were cases in point, you made claims that
exceeded the physical limits of the memory bus and screen DMA.

Here you claimed you claimed both the PC and MAC could do screen
switching and that you had done it yourself and you got it WRONG. Dont
give me that guff about individual cards doing it. You implied that all
PCs could do it as standard. You seem to have got the MAC claim totally
wrong - AND lied about programming it youself.

Gavan

994. Re: Press coverage of Jaguar in UK

>markets, and the machines start rooling out then. The article was
>really only critical (and rightly so) of the low number of games on
>hand. That is the only basis they gave for their claim of "ebbing"
>Atari marketing.

They werent just slagging the lack of software (which Atari have
alsways been poor at) but the quote referred also to the pathetic attempts
at advertising (another traditional Atari weak-point). This magazine is
unbiased, so they really were reflecting the state of things as they were.
If anything, they would be biased towards the Jaguar as they really favour
hi-tec systems, even if they are comparitively unknown. eg they gave the
Neo-Geo a lot of coverage and also the PC-Engine which is unknown here.

>Geez, quoting game mags - really!

Well, since the Jaguar is a GAMES CONSOLE, I think its fair to quote
games mags which will be read by anyone considering buying the thing. Edge
seems to be quite well respected, especially by people looking for
`cutting edge` systems as it is very upmarket and aimed toward new
technology. Its just the sort of opinion-forming publication that can make
the difference to anyone considering buying a system like the Jaguar.

Gavan.

Second worst - the *WORST* CPU-RAM interface has to be the FALCON ;-)

try an A3000 or A2000 with 040 card for better speed. How does the
Falcon 040 compare ;-p

>With the other custom chips being able to block the CPU, I can't see
>the advantage of that. Ever used 640*480*256colours in an acceptable

>Mac's one :-).

Ever heard of fastRAM? All A4000s have this. Here, the custom chips
have no access and cant block the CPU.

The 640x480x256 NI screen is slow because it is PLANAR. Any likeways
arranged screen will be the same. I dont think the Falcons 256 colour
screen will be much faster since it uses the same basic architecture.
Also, how does MTOS in the Falcon running a screen in this mode compare to
AmigaDos, the MAC or Windows for speed of screen updates?

>Did you know that reading PC-formatted HD-disks eats up to 30% of the
>processor time on a 4000/040 (according to DirOpus' status line)?

Thats because the Amiga runs the PC filing system as a mounted file
system. The basic Amiga disk format is far superior to the PC/TOS - long
file names, soft and hard links, more on a disk etc. If you want to access
PC disks you simply mount a PC file system (eg CrossDos comes with
AmigaDos 3) and you can access them transparently. Sure theres a little
processor overhead when reading writing, but it not like you are accessing
the floppies more than about 2-3% of the time. Are there any programs on
the PC or Atari that let them read Amiga disks?

Gavan.

A typically stupid Atari viewpoint. I notice that there is a campaign on this group to get PageStream 3.0 on the Atari - its already out for the Amiga. Obviously the manunfacturers of this program recognise that the market for SERIOUS software is much greater on the Amiga than the Atari.

Wheres all the Atari Multimedia software? I dont see anything like Scala, MediaPoint, Helm , CanDo etc on the Falcon. How about image processing, what does the Atari have to match AdPro/MorphPlus, ImageFX/Cinemorph or ImageMaster? How about 3-D rendering, where are Real-3D, Imagine, LightWave, Aladdin? Wheres productivity software like WordWorth3 or Final Copy2 on the ST? DTP has Calamus is suppose, but Amiga owners have PageStream3 AND ProPage4.

Face it, the A1200 has a wider user base and therefore much more SERIOUS software available *AS WELL AS * all the best games.

Gavan.

: Mac's one :-).

That's correct, unfortunately. So the hardware side of the Amiga might
not be the best. (Remember, though, that the processor can run other
tasks while the foreground task is waiting for the blitter. We have
both pre-emtive multitasking and fast mem. When a Mac is waiting for
something, so is the user. :)

: >>PS. Did you know that moving the mouse around the screen really fast on a PC

: Did you know that reading PC-formatted HD-disks eats up to 30% of the
: processor time on a 4000/040 (according to DirOpus' status line)?

Obviously, the slowdown is directly related to the word 'PC'. :)

Seriously, who cares about either of these statements!? They are obviously
software artifacts or, most hesitantly, possibly some indication of a
hardware limitation. This has very little to do with the overall system
performance. (I don't spend most of my time by a PC furiously shoving
the mouse around, and I don't use PC formatted floppy disks on my Amiga
unless I plan to transfer data to or from a PC or a Mac. And then I'm
waiting for the drive to complete the reads or writes, so I'll have to
wait, anyway.)

Regards, Kristofer.

What's your problem?

My A1200 has a 120MB hard, 10MB memory (8MB fast), a 40MHz MC68030 and a
40MHz MC68882.

Why on earth would I buy such a system for just playing games on it!!?

Think again. /Kristofer.

}
} You can get the template for an AmigaDOS command by typing the command name,
} followed by a question mark, it then goes into interactive mode. The template for
} copy is something like:
[deletia]

Hmm, seems to me that the template thing is just the usage method. The
interactive part sounds useful, though. Does it (if you type in too
few arguments, say) ask you for the remainder, telling you what they
are ? That would be useful for beginners. Un*x doesn't do anything
like that, but zsh (an enhanced sh clone) does. If you type (for
example) ls [help] and you have [help] bound to the help-keyword
function, it'll put up an entire page of help for you inc. examples,
press [return] and it goes away to what you had on the screen before.
Still, no interactivity as described above.

I think the regexp stuff is pretty much common to both. Any shell
worth the name can do the sort of matchings you were talking about.

}
} Arexx programs are executed by sending the program to the Arexx port of the Arexx
} interpreter. You don't necessarilly have to wait for the command to finish, so
} you can fork off another thread by using the interpreters Arexx port. You can
} talk to the shell in a similar way, only instead of sending Arexx commands to the
} Arexx interpreter, you send shell commands to the shell's port.
} That explanation is a bit dodgy, and if you want a better one, ask and I'll go
} and fetch my manual :-)

Right. So I could do a popen("/bin/sh", "w") or to any shell, and just
fprintf() the string containing the program to it, then do an fread()
on the file pointer returned by popen() to get the results.

I think the real advantage (I've been told) of Arexx is that it's
graphical. It can do GUI things. That's much harder under normal TOS
(easiest way I can think of is to have an accessory running, and talk
via the GEM tube, getting the acc. to do the gui stuff)

Under MultiTOS of course, it's as simple as X.

Simon.

:>>(thats 2 24 bit reads every 2 cycles at 32mhz.)
:>
:>>The DSP does not have access to CPU memory, it is not designed for this
:>>really anyway, its address space is only 65kwords in X,Y,P memory.
:>Right, so lets get this clear. The CPU must pass data to the DSP via the
:>HOST PORT which has a 3meg/s bandwidth. So how on earth do you propose to
:>xfer the 6.25 Meg/s needed for your 25FPS `256colour dual playfield` claim?
:> You have the CPU reading/writing 6.25Megs/s to/from memory AND then
:>passing that data on to the DSP through a bus. And you said that you had
:>already written the code to do it - you really have no credibility!!

Please do not say crap like this, the dual playfield using DSP is acheived
as follows:

DSP holds 256 colour RGB lookup for playfield 1
" " 2
DSP holds playfield 1

The Cpu sends playfield 1, and the dsp combines them (using the two
palettes).

This as I said acheives 25fps++. You HAVE NO CREDIBILITY GAVAN, please
don't think you can beat me on a technical argument like this, I think
and have the know how to post such stuff.
Kind of makes you silly again.

:> Could this be yet another case of you making something up just coz you
:>cant admit you are WRONG!?

I don't make things up, anyone with who owns a Falcon will be laughing at
you right NOW. BTW I just proved you wrongm if you didn't notice already.

:> Just look at the case you have cited. Not only do you make claims that
:>exceed the capacity of the host port, but you also exceed the capacity of
:>the CPU for data throughput. Furthermore, all your method involved was
:>reading/writing memory and doing a simple lookup - virtually no
:>processing. Yet you still had to throw in a line saying how the DSP would
:>speed it up blah blah when in this case its precisely the sort of thing
:>that WOULDNT be sped up by the DSP - the limit is CPU memory accessing and
:>it requires MORE of this is you use the DSP. I cant beleive you claim to
:>have already coded such a routine, unless you mean something like 100x50
:>pixels playfields.

In this case I am *correct* because the DSP can loose the need for a
colour lookup table because it can calculate the combined colour very
easily.

:> Since you always cite the DSP as bumping up the performance, perhaps
:>you can also explain what happens if you have two programs using the DSP
:>for different things. eg. one wants to decompress a JPEG and the other
:>want to do your dodgy sounding floating point multiply routine. Is there a
:>part of the OS which lets you manage program/data memory space within the
:>DSP and how do you deal with pre-emptive multitasking - does the OS
:>interrupt a program running in the DSP , execute your new code and then
:>return to the other program? I doubt it somehow - the DSP is a **LOT**
:>less useful for general computing than you make out. It is a very
:>effective processor of digital signals (as the name implies) but for
:>general purpose computing on a pre-emptive mulititasking OS its very
:>ineffective.

Yes the OS provides such stuff, and Yes I can play 4 channel sound while
the DSP does other stuff if I put my mind to it.

> more than a niche one.

Personally I have always found that Windows on the PC a very slow and cumbersome
piece of software. The desktop environment is also too slow for proper use,
catalogue a disk and you'll see.

I think it is about time PC's were dropped from the market in favour of a more
modern machine (pref. the Arc!). PC design is about 20 years old, and yes I do
know that the 486 whatever speed /2.... and Pentium are modern processors. But
why oh why put them in a box where the base architecture has to be compatible
with the 8086? Surely there is some progress in PC design, but alas not.
(Please no flames about VESA and the like).

Also Pentium - waste of space. One machine I saw had a price tag of 3000 ukp,
had two 450W power supplies, had 5 cooling fans, and was unable to run without
the case on it. ==> Intel have guffed up here! It's almost cheeper to run a
1KW electric fire than this pentium based PC.

Actually, thats what we have come to expect from the GAMES CONSOLES of
today!

Still, I have to admit that the Panther (ooops, sorry, I meant the
Falcon) has GREAT games console specs. Too bad there isnt much in the way
of games for it. They all seem to have been developed for the more
popular, serious ;-) , computers like the Amiga and PC.

>I also was unaware that you could get a 1 meg Falcon in the UK as 1 meg
>should of been dropped and most developers will not look at the 1 meg

>as a problem but look to develop for 4 megs or even more .....
>(but if you knew anything about a Falcon you would know this already !!!)

Yes, you CAN buy 1 Meg Falcons in the UK at least. I say Ladbroke
computing ads for 570UKP and Silica Shop selling them for 500UKP. I think
Atari are trying to make it affordable for ST owners to upgrade, even if
the resultant computer isnt much use as configured, you can always use it
as a fast ST until you can afford more mem and a HD.

All serious software developers develop for Amigas with 4 meg+ of RAM,
most new products need such a config and a HD to even work. The limit of 2
megs chipram only on the cheapest A1200/CD32 is really only there for
games developers.

Gavan.

Just to make a point:

A person I live with used to have a 386 PC with only 2 Megs. He downloaded a load of JPEGs and the only viewer he had (CorelDraw) could only display GIFs So I got out my copy of ArcJPEG (not the faster program ever) and sort of set up a processing line - I would convert the JPEG to GIF - chuck it to him (by disc of course) and he would copy them to his HD and display them - I had to use RAM disc (my HD is 150 mile away) and an ARM2 and I managed to convert the JPEGs to GIF AND get them on disc (which is *very* slow) before he could even display the GIFs...

Yes I agree. Esp as the 80x86 is based on the Z80 - a 19 year old chip...

```

I think this would be faster, the F030 has got a cache you know...

```
a0=address of sprite data in above format
a1=screen address(at current x,y pos of sprite)

move.w (a0)+,d0 ;get number of structures needed to make sprite
spr_draw_loop:
add.w (a0)+,a1 ;add offset to screen address
move.w (a0)+,d1 ;get number of words to draw MINUS ONE
loop: move.w (a0)+,(a1)+ ;put data on screen
dbf d1,loop
dbf d0,spr_draw_loop
```

It's just a thought.

```

:>loop: move.w (a0)+,(a1)+ ;put data on screen
:> dbf d1,loop
:> dbf d0,spr_draw_loop
>It's just a thought.

Yes that would be faster than the routine suggested by Alan,
however I think code generation would result in faster sprites, without
that much overhead in memory , heres my rout.

; a1=screen address(at current x,y pos of sprite)
move.w #$ffff,2(a1)
move.l #$ffffffff,320*2*1(a1)
move.w #$ffff,(320*2*2)+2(a1)
rts

would be the code generated for a '2x2' star.
the sprite code generator could optimise for consequetive writes by
using post-increment addressing or lea's where appropriate, the same
technique was used on the ST for 'pre-shifted sprite data' which resulted
in double the amount of sprites able to be drawn. (The record was 22
32x32 16 colour sprites which is more than the Amiga blitter can do).

>True, but sales are going upwards. (Even magazines here admit the "Atari
>Community" is moving .... a PC magazine ... in the same article they declare C=
>as DEAD .. :-/ ...)

Don't get me wrong i hope the falcon will sell to as many people who want
one but the rise is normal its/was winter time in europe which should mean
higher sales. Secondly its kind of stupid to state 'atari is moving and
C= is dead' when its very clear that both the a1200 & cd32 & falcon sales
are up and the a1200 & cd32 are still outselling the falcon & jag at 10:1
or more. Dave is posting new releases for the cd32/a1200 all the time and
some of the steam seems to be out of the jag ..... i like the jag & the
falcon but claiming that atari is doing better than C= is not shown in
the number of units sold or the programs released.

does anyone have any new numders on the jag sold to date & the release of
jagCD unit ?

Well you can slag down PCs all you want, however a 386/486 in protected
mode is semi-decent. And the compilers for the architecture are really
good. Yeah sure on-paper the architecture is crap, but it does what people
want and does it fast! I honestly think the the 80x86 architecture is
better to compile for than the 680x0 series, I'd be interested in someone
arguing otherwise.

I really hate this kind of mindless slagging down of any computer, you
can say exactly the same of the 68000 series , the 8 bit processor
series (m6809 etc) which was the fore runner to the 68k.

No they won't both the C= and the Atari line are outperformed for years
but there will always be people who don't want to turn to a perfect system
that expects its users to be stupid & PR driven. This may be a big shock
to you but there are still people out here who have simple fun in hacking
around with there hardware & writing software for it. We all heard it
before didn't we (mac,mac-ii,mac-gs, quadra's, mac-av and now the powerpc)
and we are still here still getting machines that in your eyes are
overprices underpowered and dead.

atleast in my area there seem to be more and more people getting pissed
of about new hardware/bigger software and the 'perfect' OS and turning
to other systems just for the fun of it (like running linux). The question
is not will the powerpc kill C= & atari but will C= & atari kill themselfs
by screwing over there very loyal users again and again or will they just
keep it down to a level that we blaim them for everything but still buy
there machines enough to keep them going like the last 10 years.

PCs work because they have brute processing power and a mountain of kludges
to cover up and inherently slow and dated architecture - even in 82 or
whenever they appeared, they were hardly leading edge. Local bus and such
have helped but at the end of the day, the PC is not a nice machine.

Luckily, there is some very nice software for it. I'll buy one later on in
the year because I need to to practice/learn (more) DOS/Windows/BSD etc. to
make myself more marketable and to have a system at home like I have at
work. Well, close anyway.

We have a PC laptop at work with full BSD, X, Ingres, Ingres Windows 4GL and
a load of support software. Now, that I would like at home :-)

I have used PCs a lot over many years and all I know is they aren't very
compatable, add-ons rarely work first time and getting multiple add-ons
working together is a true voodoo art. Windows is less than pleasent. On the
upside, Word for Windows and Excel are truly wonderful products.

Not as nice as modern processor architectures, however the PC is
not as bad as you might think, the instruction set with its limited
number of registers is easier to optimise for than the 680x0 series (IMO)
for example I can write code that is 2-3 times faster than a compiler
on a 68k based machine, however I half to work really hard to beat the
compiler (say Watcom) on an Intel.
DOS is the why there are still kludges left in the chip, however 386
protected mode gives a memory model that is as good as the 68k series.

:>Luckily, there is some very nice software for it. I'll buy one later on in

To put it simply, no. Not even close.

The ideal architecture for a compiler designer is one consisting of lots of equal registers, where "equal" means that you can perform instructions on any register you wish rather than a subset of the registers. The Intel x86 has 4 general purpose registers, the Motorola 68k has 16 general purpose registers. (This is with a loose definition of general purpose; better examples of CPUs with equivalent registers include the MIPS Rx000, the Sun SPARC, the Alpha AXP, etc.) The whole point behind RISC CPU design is to produce CPUs that are well suited for good compiler design.

The Intel line has so few registers available that it is very difficult to perform global code optimization because there simply aren't enough registers available to hold temporary values without spilling them to memory. However, people have spent a lot more time, money, and effort designing x86 compilers, so they have a lot of special-purpose code that performs local optimizations ("peephole" optimizations) that aren't needed or useful on more RISC-like CPU's.

An experienced assembly language programmer can write better code then an optimizing compiler on the x86; but the compiler will typically produce better code than an experienced assembly programmer can on a RISC-like CPU, such as the Sun SPARC. This is especially true on newer CPUs where you have to start dealing with hazards, as human programmers are very bad at anticipating pipeline stalls. Would you rather write code in assembly for a Pentium or in C for a RISC CPU? Note that C code is portable, and your assembly code is not.

:>To put it simply, no. Not even close.
:>The ideal architecture for a compiler designer is one consisting of lots
:>of equal registers, where "equal" means that you can perform
:>instructions on any register you wish rather than a subset of the
:>registers.

Yes for 'on-the-fly' code generation an orthogonal instruction set is
better, however I am talking about optimisation here. A RISC based
machine is better to compile for, however we are comparing the 68000
and 808x6 here.

:> The Intel x86 has 4 general purpose registers, the Motorola
:>68k has 16 general purpose registers. (This is with a loose definition
:>of general purpose; better examples of CPUs with equivalent registers
:>include the MIPS Rx000, the Sun SPARC, the Alpha AXP, etc.) The whole
:>point behind RISC CPU design is to produce CPUs that are well suited for
:>good compiler design.

The 680x0 is very CISC, it has some very very complicated addressing modes
, far more complex than the 80x86, I have *never* seen any compiler that
takes advantage of any of the more complex modes.

You can argue that with less registers there are less registers to
try and optimise for, hence it is easier to optimise 80x86 code. In my
experience I have found this to be true, you can spend all day trying
to save an extra register to get extra speed, register optimisation is
a subject of research. (there are many suggested strategies).

:>The Intel line has so few registers available that it is very difficult
:>to perform global code optimization because there simply aren't enough
:>registers available to hold temporary values without spilling them to

:>designing x86 compilers, so they have a lot of special-purpose code that

:>performs local optimizations ("peephole" optimizations) that aren't
:>needed or useful on more RISC-like CPU's.

Function level optimisation, is the most important IMO, peephole optimisation
is particularly well suited to the 80x86, as well as all the other text
book methods like 'strength reduction', 'loop invariance' etc.

:>An experienced assembly language programmer can write better code then
:>an optimizing compiler on the x86; but the compiler will typically

what I am saying is that people can beat the compilers by a great
distance on a 680x0, now this is either the fault of the compiler on
the 680x0 OR the 80x86 compilers are a lot better. In a way I am
trying to suggest the the 68000 is more 'N-complete' ;-) than the
80x86, hence there are more possibilities for optimisation on a 680x0,
hence it is harder to optimise for.

:>produce better code than an experienced assembly programmer can on a

:>CPUs where you have to start dealing with hazards, as human programmers
:>are very bad at anticipating pipeline stalls. Would you rather write
:>code in assembly for a Pentium or in C for a RISC CPU? Note that C code
:>is portable, and your assembly code is not.

I write in C on my 486, assembler and DSP assembler on my Falcon.

>Reference: "Compilers: Principles, Techniques, and Tools" by Aho, Sethi,
>& Ullman

Good book that, sitting on my shelf but to argue that a compiler will be
able to beat an experienced human is madness, since a compiler cannot
have 'leaps of intuition' and suchlike which lead to optimisation. The
heuristics and knowledge which we can draw upon when optimising code
is very difficult to build into a machine. But I agree with you about
portability, writing assembler is generally not worthwhile esp. with decent
C compilers.

No, I don't forget that. But then, I guess ATARI must be really
big and kiking butt all over the Swedish computer market...

Not trying to defend Rickard here, but just because the Falcon is 'better' for music and just because the Amiga is well known and established in the video arena, does this mean that the Falcon can not be any good at graphics?

It would be nice if people would stop argueing over things they know nothing about. If you want to advocate your favorite machine that's fine, but stop putting down others when you have not even used them. And please stop using something you 'heard' on the net as a basis for your arguements. Things can get really out of hand when you propagate some of the crap that shows up here.

(Hey I can wish can't I :)

BTW, I have been using Ataris since 1980 and have never even seen an Amiga computer. From my perspective they are a non-existant (niche) computer with no software or support. But do you see me saying anything (good or bad) about them? NO, because I'd be talking here-say and posting what someone else had said about them and I'd have no personal experience to back any of it up (like a number of other Gavan Moran types around here). I therefore keep quite until I can talk about something I know.

Of course, that would make this advocacy group really boring and I doubt anybody would listen to me anyway... so carry on.

RandyH

> :>>it would be the only choice..

We use PSY-Q for our A1200 stuff, its the Psygnosis Cross-Development Env`nt,
On a 486-50 with a Cached I/O card it assembles 38,186 lines of code (not
counting expanded macros) with 26 included source files, 40ish bin files in
around 5 seconds, and a further 3 seconds to download and Run 1.8mb of
data. anything else just wont do 8-)

|> are very bad at anticipating pipeline stalls. Would you rather write
|> code in assembly for a Pentium or in C for a RISC CPU? Note that C code
|> is portable, and your assembly code is not.

Agreed. Some RISC CPU's are really nasty to write code for. Things such as the Branch Delay Slot, for example, on the MIPS RISC series make it sometimes fairly difficult to see the best way of ordering instructions to the assembly coder. Optimising compilers designed for a certain type of CPU will generally produce faster code, and, of course, it means that the programmer does not have to learn the assembly language for a lots of different CPU's, as well as having to learn the best way to order instructions (which is sometimes far from obvious.) I'd say that very few things should be written in assembler at all on a modern system. (Exceptions would be parts of the task switcher, lowlevel filesystem etc.)

But GAME MAGS produce some of the worst sort of favortism and
incorretness of any possible magazine, and have almost nothing useful
that hasn't already been discussed to death here for months. I don't
know why they were attacking the Jaguars advertising, but they really
presented no logical reason for doing so. Thus is the danger in
quoting game mags, you loose hold of reality.

I have to really work hard to write Intel code at all. It's a bloody
nightmare, particularly when you start getting into the 386 instruction set.
You have about 59 bytes of escape codes before you even get into the native
op codes, by which time you've give up and are reaching for a large gun to
end it all...

I truely pity 386 compiler writers. It's a dog's life.

Anyway, I suppose a compiler for a stack machine would be easy to write, and
hard to beat. It all depends how low you're prepared to go, doesn't
it...persoanlly I don't think ax, bx, bc, dx, ex, pc, si, di, pi, qi, zi,
redi.... are so nice. General purpose regs might be better. The 8086 was a
super-expanded z80, not a good basis for a 12-year product line.

Confusing the Panther (oops - you mean Jaguar) and Falcon? Which is
the more serious machine- the one that has 4MB memory and 85MB HD +
real ports standard, or the one that doesn't?

That's good, that they keep up with serious Falcon developers that
also assume 4MB+ of memory.

You think so? Look at all the performance tradeoffs that have been made
to support those sprites. For a start, the clock is slower.

Take the TT for example - they didn't put a Blitter in it, because the
blitter was slower than an 32MHz 030. Fortunately not too much sw makes
assumptions about extra hardware like that.

He talking about Silicon Systems mail order. He couldn't comment on anyone else. I also agree that the increase was impresive, but it was starting from a low base.

It is intersting what level of sales was needed ti get the shops even to have a display model. I think their ssales would have been much higher if they had put a demo model up months ago.

One exception to this rule is the ARM. You don't have to worry about
ordering conditional instructions, and all instructions can be conditional.

As an aside, I read somewhere that ARM code on average tends to be only
about 80% of the size of equivalent SPARC machine code.

> arguing otherwise.

Just to mention again - the 80x86 is out of date - CISC is deadend - nearly
every major IC producer makes RISC chips now.

Also, the main problem with the PCs is the operating system is apalling
written. It is basically the same as it was 10 years ago, when the PC's main
competition was the Commordore Pet! And as IBM make every machine downwardly
compatible, the usefulness of the chip is stopped by the limitations decided
10 years ago, based on a time when 256k was thought to be more memory than you
ever needed, and the average WP occupied 5k of program memory... (Though nowadays
WP's occupy about 4M of memory and do very little more :)

Also the 80x86 loves power. I notice that they have made a Cray 2-type cooling
system for PCs now - you need it with anything more powerful than a 386 :)
Compare this to the low wattage of the ARM. Though this does mean that if you
own a pentium you don't need to by a heater for your room - the chip'll do it
for you :)

> I really hate this kind of mindless slagging down of any computer, you

1044. I admit envying *one* property of Amiga...

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-01 10:21:54 UTC
From: t150315@lehtori.cc.tut.fi
Message-ID: <2kv502$r1f@cc.tut.fi>
Source record: 18345

Damit, I have to admit that Amiga has one thing I envy:

Functional multitasking fileoperations (whereas Atari ones hog a *lot*
of CPU time for them). One DOS type looked mouth open while my friend
opened a zipfile on his harddrive and copied some jpegs to my floppy
at the same time (and of course there was a mod playing at the backround
as usual).

On the programming side Amiga is a bit more modular (being multitasking
from a start, it has had quite a lot of time for improvement), but lack
good Resource editors.

Amiga also lacks desktop replacements (yes there are Magic WB etc., but
those only affect looks, not functionality). There are separate utilities
for specific purposes (filemanagement etc.), but that's a clumsy way to
do it.

Of course it's easier! If you had no registers it would be easier still!
It's easier because you are restricted in the amount of optomisation that
you can do.

>Please do not say crap like this, the dual playfield using DSP is
>acheived
>as follows:

>DSP holds 256 colour RGB lookup for playfield 1
> " " 2

The lookup table was 64kbytes long, wasnt it?

>DSP holds playfield 1

Assuming playfield 1 is the standard 320x200x8bitplanes then this also
needs 64kbytes.

Thats 128kbytes needed to hold your LUT and one of the playfields.
Didnt you say above that the `DSP has 32kwords of 0 wait state ram` -
thats 64kbytes isnt it? (Or maybe you are counting words as being 32 bit-
thats fair as the DSP is 32bit - so lets assume the DSP does have the
128kbytes needed to hold both your LUT and playfield lets cut the
playfield down a bit to incorporate the DSP code though)

>The Cpu sends playfield 1, and the dsp combines them (using the two
>palettes).

uh-huh. The CPU still has to transfer a 320x200x8bitplanes playfield
25 times a second to the host port. Thats ~1.5 megs a second. How fast can
the CPU shift memory? AND thats assuming that its just a matter of
shifting the memory (16 bits?) at a time to the memory mapped I/O address
of the host port - thats 3 million seperate transfers a second (only 16
bits moved on each transfer). Can a 16Mhz 030 shift data at that rate?
Maybe you can use the blitter to do it (but I doubt it)

Anyway, even assuming this is possible, once the DSP gets the other
playfield and combines it , you have to send 320x200x16bitplanes back to
the CPU 25 times every second - thats ~3 megs per second. Didnt you quote
the DSP host port as having a 3meg/s bandwidth? You have a total of 4.5
megs a second moving here.

>This as I said acheives 25fps++. You HAVE NO CREDIBILITY GAVAN, please
>don't think you can beat me on a technical argument like this, I think
>and have the know how to post such stuff.
>Kind of makes you silly again.

Of course, the CPU now has to take that 3 meg/s coming from the DSP
and put that into the screen area for the 65k colour mode. Thats about
another 6 million 16-bit word transfers per second.

* You now have the CPU doing 9 million memory transfers a second - are you
saying a 16 MHz processor can do this? *

Especially when the memory can only be accessed 16 bits at a time by the
processor and is shared with screen and IO DMA.

AND we havent even started to talk about how we go about updating the
playfield held in the DSP - thats going to need additional code at the DSP
end to handle playfield updates and of course, even more CPU memory xfers.
Plus, where does that leave the CPU any time to execute your other game
code?

I may not be a Falcon/DSP programmer, but I dont need to be in order
to disprove your fantastic claims. I`ve a Masters Degree in Electronics so
I know enough to say that your claims often exceed what the hardware is
actually capable of.

>:> Could this be yet another case of you making something up just coz
>>you
>:>cant admit you are WRONG!?

>I don't make things up, anyone with who owns a Falcon will be laughing >at

You just kept spouting on. Never mind, maybe if you cut down the rez to
160x100 you MIGHT be able to physically shift enough memory to make a
display, even if there was absolutely no processor time to do anything
else.

>:> Just look at the case you have cited. Not only do you make claims

>colour lookup table because it can calculate the combined colour very
>easily.

Well, that gets rid of my `dsp not having enough memory to hold the LUT
and playfield niggle, but you did *say in your post*:

"DSP holds 256 colour RGB lookup for playfield 1"
" " " 2"

Now please `educate` me on how you are going to even manage all those
memory transfers.

BTW Didn`t someone post here a while ago that the Host port was only eight
bits wide with 2 megs/s bandwidth? You claimed at the time that this was
not a limitation and no-one was likely to exceed this amount.

Gavan.

:>want to do your dodgy sounding floating point multiply routine. Is there
a
:>part of the OS which lets you manage program/data memory space within the
:>DSP and how do you deal with pre-emptive multitasking - does the OS
:>interrupt a program running in the DSP , execute your new code and then
:>return to the other program? I doubt it somehow - the DSP is a **LOT**
:>less useful for general computing than you make out. It is a very
:>effective processor of digital signals (as the name implies) but for
:>general purpose computing on a pre-emptive mulititasking OS its very
:>ineffective.

>>Yes the OS provides such stuff, and Yes I can play 4 channel sound
>>while
>>the DSP does other stuff if I put my mind to it.

That sounds like `No, the OS doesnt provide support for multitasking
and memory management with the DSP` - please elaborate.

I didnt ask if you could play 16bit sound whilst using the DSP anyway
- the 16 dit sound is DMAd seperately from the DSP surely? You only need
to use the DSP if you want more than four channels.

What I **DID** want to know was what happens if two programs try to
use the thing at the same time. You were claiming you could use the DSP
for FP multiplies etc - well, this means it is quite likely that if
programs *were* to use the DSP extensively on the Falcon (which they
mainly DONT anyway due to lack of software development), then we would see
tasks clashing over DSP use. How is this handled? It sounds like you could
be spending a lot of time sending programs to and from the DSP.

: Just to make a point:

: A person I live with used to have a 386 PC with only 2 Megs. He downloaded a
: load of JPEGs and the only viewer he had (CorelDraw) could only display GIFs
: So I got out my copy of ArcJPEG (not the faster program ever) and sort of set
: up a processing line - I would convert the JPEG to GIF - chuck it to him (by
: disc of course) and he would copy them to his HD and display them - I had to
: use RAM disc (my HD is 150 mile away) and an ARM2 and I managed to convert

I'm suprised he even got CorelDraw loaded on a two meg 386. Was this
the current Windows incarnation, or something pre-Windows? If he was
smart, he would have used Qpeg under DOS, blazingly fast JPEG displays,
but it does use a quicker, but lower quality display algorithm.

Give a competent tool to an incompetent and you'll still get incompetence. ;)
This isn't such a great example of Interface vs Interface.

ho ho! When I said that the A1200 could do 1280x512x260000 colours you
implied that the Falcon could do the 1600x600x65000 colours. You did say
you were working on it, and had to do something else, but your post
definitely suggested that the it was just a matter of getting round to
doing it.

Not a typo. That was the price advertised by Ladbroke. They were also
selling 4/65 Falcons at 870 UKP. Silica shop were selling at 499UKP with
the 4/65 config at 799UKP. I`m glad you admit that there are places
selling 1mb Falcons though - its a fact hotly denied by many on this group.

>>;-)

>Nah, the Falcon overcomes thsi dificulty fairly well...

Falcon owners often claim that the 256byte caches in the Falcon go a
long way towards nullifying the 16 bit memory access (ha ha ha). The 040
has twin 4Kbyte caches - slightly more effective in this area I would have
said. Especially since the problem is with bus timing and the CPU of
course has full 32 bit access.

>I have no need to read Amiga disks. How many SCSI CD-ROM drivers are
>there for the A1200?

I`ve no idea as I dont yet have a CDROM drive. I do know that there are
a couple of low level CDROM device drivers about, including a PD one.
There are also a couple of complete CD filesystems which I think have
their own SCSI drivers. The 3.1 os revision (as found in the CD32) has a
CDROM filesystem and there is also the Babel CDROMFS plus others.

Thats the video games business for you. If you want to sell games
consoles then you are competing in this arena. Prospective buyers of the
Jaguar will read a lot of these mags. They dont slag off nintendo or Sega
for naff marketting or software support - They slagged the Jaguar
advertising since they considered it to be naff.

They should know, they see a wide spectrum of products and promotions and
are probably the best informed of anyone on these matters.

>Confusing the Panther (oops - you mean Jaguar) and Falcon? Which is
>the more serious machine- the one that has 4MB memory and 85MB HD +
>real ports standard, or the one that doesn't?

No, I just think that the Jaguar seems to bear an uncanny resemblance
to what Atari had announced for the Panther specs - 16 bit sound, DSP, 65k
colour mode, `32-bit` processor. The Falcon arcitecture seems geared more
to video DMA (32 Mhz/32 bit access) than it does with providing max CPU
power - only a 16Mhz CPU with 16 bit memory access.

As for the Falcon having that 4 meg and 85Meg HD as standard, you can
buy A1200s with 6 megs and an 80 meg HD from Power Computing in the UK for
a LOT less than the Falcon costs here.

>> Yes, you CAN buy 1 Meg Falcons in the UK at least. I say Ladbroke

>Possibly, but like I said that is not the base configuration. I can
>buy a 486 MB all by itself, do you consider that the "base" pc config?

No. I consider the `base` PC config to be 4/170/SVGA. The Falcon is
4/65 or 80 and for serious purposes the A1200 is 6/80 (which I and the
Majority of A1200 owners on UseNet have).

Yes, when you have *SO MUCH* high quality MM software for your machine, some of it doesnt make the grade like AmigaVision or HyperBook. Mind you, hyperbook is OK for simpler tasks. I got my copy off the front of a UK magazine and I`m not complaining!

It may be semi-decent at the moment, but it's not going to go much further. Given how wonderful the Pentium isn't, any 686 is really going to be scraping the barrel. What's more, students won't be allowed to use them due to restrictions on room-heating equipment im most UK universities...

However, other chips do have the potential to progress a long way. They should start to take over from the 80x86 machines as soon as possible.

The clock is slower then what? The Amiga pixel clock is 28MHz for various reasons
to do with the PAL and NTSC video standards, I believe, and the provision of
MOB's has nothing whatsoever to do with it.

|>
|> Take the TT for example - they didn't put a Blitter in it, because the

Wasn't the reason the CPU was faster on the TT something to do with the STE
blitter being useless at shifting?

if the playfield was 2/3 screen size, there would be a reasonable amount
of time for such updating. The dsp can scroll such a playfield in
about 40,000 clock cycles (about 10%?).

:> I may not be a Falcon/DSP programmer, but I dont need to be in order
:>to disprove your fantastic claims. I`ve a Masters Degree in Electronics so
:>I know enough to say that your claims often exceed what the hardware is
:>actually capable of.

Read above: The only argument is to exactly how fast it goes, I just proved
above that it is nearer 25fps. With this claim I am right.

:> You just kept spouting on. Never mind, maybe if you cut down the rez to
:>160x100 you MIGHT be able to physically shift enough memory to make a
:>display, even if there was absolutely no processor time to do anything

:>else.

actually for the 1600x600, mode I have it displaying 128x600 at the
moment ;-). I always said this was theoretical, but 1600x600 in other
modes have been acheived,

:>>In this case I am *correct* because the DSP can loose the need for a
:>>colour lookup table because it can calculate the combined colour very
:>>easily.
:> Well, that gets rid of my `dsp not having enough memory to hold the LUT
:>and playfield niggle, but you did *say in your post*:

Yeah, perhaps you should have read the whole post before replying and
jumping to slagging me off so quickly. You just went back on everything
you said. I'd prefer not to argue about this, its going to end up
with me saying something like 'ok.. i'm wrong it goes at 24fps and not
25fps. ok? pedantic pedantic pedantic.'

I'd be inclined to disagree. May be having fewer registers makes optimisation
simpler, but having dedicated registers as opposed to general purpose makes
it harder, and from what I've seen, compilers tend not to make use of the
x86's CISC functions, such as string functions (block memory transfers).

Have you considered the possibilty that maybe Watcom have put a lot more
effort into the optimsations than the people who wrote your 680x0 compiler?
(I'm assuming that you are accomplished enough in the art of x86 programming
to justify your statement that you found it difficult to beat the code
produced by the compiler, Griff).

SEE ABOVE ARROWS. Not that many people can afford workstations of any kind and if they could it wouldn't be much use to them(where would they get the software from let alone afford it?)
Everyone else in the world uses:

1) PCs
2) Macs
3) Commodore Machines (Amiga)
4) Atari Machines (ST, Falcon)

Maybe that list is in order of no. of owners, maybe not?????

> Dave
>

BTW, I have an STe, which I am not proud to own, but then again I bought it over four years ago when it weren't too bad....

Alan.

1067. "THE WAR OF THE WORLDS" by :

Newsgroup: comp.sys.atari.advocacy
Date: 1994-03-01 15:47:07 UTC
From: avarum@cs.vu.nl
Message-ID: <CLzt6L.LIq@cs.vu.nl>
Source record: 18368

My organisation probably know neither Amiga 1200 nor Atari Falcon!

Okay.... I've had enough of this... Please excuse me my untactfulness/unpoli-
teness or whatever foul language I may start using, but these conversations
here on the net sometimes are very 'uncool'. The only positive thing about
all this crap is that you learn a lot about your own machine, and a couple
of other machines, but for the rest...

Anyway, I'll enlighten you with some of my personal views on the matters that
have been occuring on this adv.

First of all, the Amiga 1200 vs Falcon 030 debate....
This debate is the most interesting one (for me anyway) because I get a clear
view (well, after a bit of weeding) of the limitations and advantages of both
machines...
It is a pity though, that this has to be brought in this silly and utterly
childish manner, especially the psychology bit... I 'do' psychology and this
simply makes me sick...
Anyhow, my point of view is that both computers are quite good value for mone
the Amiga 1200 because of the nice software available and the hardware provis
ions for games, which has lead to some really excellent games (for the Standard Am
iga at any rate) and a very good perspective for the machine on that (game) front
.
The Falcon on the other hand, has some very attractive hardware to offer. It
is certainly more expensive than an Amiga 1200 (though that's becoming less and
less now that Falcon prices are dropping), but you get every penny paid more back
twice and the hardware is really exciting to use. In my opinion, the DSP really doe
s it . I don't know if you ever have viewed a couple of JPEG's with the BrainStorm
/Atari co-production, but it is blisteringly fast, and certainly beats CorelDr
aw 4 on a 486 DX/II 66 (I have checked). Or have you ever tried plugging your guit
ar straight into your Falcon and add flanging, hall, reverb etc. realtime to you
r sounds! Absolutely wild. And the True Color modes are pretty great too, espec
ially because of their pixel-packed nature. Great to play around with.
True, the software is a bit sparse, but not as sparse as many (even Atari own
ers) think. One of the programs that should satisfy the Atari users that want the
quality of programs like Imagine, should take a look at InShape. That is an
extremely powerfull package that is as great as anything.
As for Image Processing, there are about four packages available, the best at
the moment probably being Studio Photo, which is almost a port of the CorelDraw m
odule with the same name.
If you are on the Lexicor mailing list, you'll know that a lot more software
is available. Like Xenomorph/Phoenix 2 and programs like that. And the most exit
ing bit of software on the Graphics front (probably) is CHROMA STUDIO 24, which w
ill be released about next month. It is a full animation package, that does all k
inds of things, includes a full morphing studio and uses the DSP for all the more

intensive tasks (!!). That program could well be an eye opener to a lot of pe
ople. Anyway, I can't wait to buy it.
The sound front, well, I think we can agree that there's not really a lack of
software on that side, so I'll just skip it.
The Games scene.
This is probably the most disappointing bit at the moment, as software houses
seem to have realized that a lot of people buy the Falcon for 'serious' usage
,which is true, but that doesn't mean that they don't want to play games on it
.Had the ST been the leading computer in the current (non-console) games marke
t, it would have made quite a difference, but unfortunately the Amiga owners hav
e that great advantage.
A bit of comfort is the support of Atari on that scene, who themselves have b
een responsible for three (as far as I know not yet available) games of quite goo
d quality, namely LLAMAZAP (Jeff Minter), HUMANS and RAIDEN .
Also a couple of independent houses have released some games, but these mostl
y were PC ports (with the exception of Golden Island, anyone seen it? and a Wol
f-enstein clone in 65536 colors).
Anyhow, the discussion shouldn't be 'Can the Falcon do it', but 'Will someone
make the Falcon do it.
In my opinion, with current pricing, the Falcon still is better value for
money than the Amiga, except when you want to play games. Because any other
application than that really hasn't the processing power available to do
interesting things with it..Agreed, the Falcon's 030 doesn't have much more,
but the DSP is there, and we have seen how capable it is of Compression,
Dithering, and other types of manipulation..
If the almighty PC doesn't throw us all out of business, then maybe we will
see which of the two will be the most successfull. Remember, it took the
superior Amiga quite a bit of time before they actually overtook the old ST.
Anyway, that's an old overused argument, but all I am saying is that the war
aint over yet, and that the battle will have to be fought by Games and Demo-
programmers.
As for the serious side, I really believe both computers will be amply sup-
plied with all most users need. With the current developments in WordProcessi
ng, you can see that programs on the PC start using Graphics instead of the TEXT
modes, which makes them lose their advantage over the Commodore/Atari machine
s and with the current method of programming, porting will be pretty easy to do
. Possibly, some other company will program a similar program that can handle
the datafiles and has the same functional abilities (as Papyrus has done,
almost copying MS-Word 6).

Anyway, I have had both computers, ST and Amiga, in the end, I think I liked
the Amiga better. I had the choice of upgrading to a Falcon or an AGA machine
(the A1200), and after a couple of months I decided to go for the Falcon,
because of the DSP and the TC modes, amongst others.

I didn't consider PC's, nobody should, unless they have way too much money.
PC's devaluate too quickly, if you bought a 286 some time ago, well...
if you bought a 386 some time ago... well.. If you bought a 486 without VESA
LB, well.... well... you get my point. In that respect, I'd rather have an
Amiga 600 than a 386 (in just about every other aspect as well).
There will also be happy Amiga/St users, who simply want to upgrade to a new

faster system, without having to learn much new stuff... They'll go for their own company, probably. And then you have coders. Well, they should simply choose the system that seems most interesting to code on. I reckon PC's are out here again, so it simply comes down to what you like to do...

There will be Musicians, who should (in my opinion) buy an Atari, and there will be Graphicians, who can buy anything they like, just depends what power they need.

So, to conclude the Amiga1200 vs Falcon debate, I myself think the Falcon the better machine (remember, built in 16bit sampling, MIDI ports, SCSI-2, DSP, easy and very fast desktop (with NVDI especially), flexible and power-full Graphics chip (even more so with ScreenBlaster and things like that), GEM/VDI being able to handle different Graphics very well), well, you get the point). But that's for me. The Falcon has no Pinball Fantasies, for instance! (Does the Amiga version have a highres option, like the PC version does?). Anyway. I would like any wars to continue only on the DEMO/Games scene from now on, would be better for all of us. It would push our machines to the limits, making them more competitive with other machines.

PC vs the World....

Well... Let me put it this way. When I bought my Falcon, I could have afforde d a 386 PC at 33Mhz, a monitor, and a sound card. I would have been very unhapp y at this moment, for reasons most of you (even PC owners) would understand.

MAC vs the World....

I have seen only incredibly lame persons here bragging about their supposedly fabulous macs, so why even bother.

Archimedes....

Nice machine... Anyone who has it, probably is quite happy...

Jaguar....

THE GAMES MACHINE, on which games will finally deliver what you pay for.
Hard to beat for games.
The biggest problem I have with it is that it can't be used on 'eye-friendly' monitors...

Sega/Nintendo..

Japanese... :) Just kidding..

just old, basicly

Well, that's just about it. If anyone is interested in making games, especial ly strategic and shoot em up, please contact me...

Oh, and what I'd like to say right now to Gavan 'Moron' is, "Thank You".
As for Chris..... Get a shrink.

Greetings,
AvIvA (AvAF030 on IRC), avarum@keg.cs.vu.nl for email.
If you have an Atari, you can call me Arwin... . ;).

"War is great!!! (On computers)"

Really??

I worked one summer with MessySoft C/C++ V7, and I'd pay what the
company payed for MessySoft's product, for the Acorn C Compiler.
Compared to MessySofts compiler, Acorn's is a lot better at finding
typo's (like a single '=' in a condition), which is what I look for in
a compiler. If the code optimiser isn't all that hot, hand edit the assembler
output. I'd rather pay good money for a compiler which warns you of incorrect
code than for a compiler with a shit hot optimiser which can't spot simple
typing mistakes, and runs out of memory even on a 4Mb m/c (it had a large memory
leak which means that consecutive runs gradually used up resources and didn't
free them, but that's a guess based on what it did, not an admission my microsoft)

If microsoft write all their products (word for win, excel, etc) in their
own C compiler, it's no wonder they are so useless.

Yours

Gary

P.S. I only had a quick look at borland's offering, and it looked much better,
ut my boss said i had to use messysofts :-(

>I'm no 030 expert, I just thought that the best thing to do was to fill the cache with >as much code as possible and then loop within the cache.....

It's not that easy.

Look at this two loops. They are equally fast!

```
move.w #7999,d0
.loop move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
dbra d0,.loop
```

```
move.w #3999,d0
.loop move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
dbra d0,.loop
```

I think it's because the "dbra" instruction is executed in parallell
with the bus-access required for the last "move".
Is this correct, anyone?

Perhaps, but the 680x0 series has many more addressing modes than the
80x86 and is more CISC in my opinion.
Having more general purpose registers means there is more combinations
of what is an optimum solution to a problem, hence this makes optimisation
more difficult than where register usage is fixed.

:>Have you considered the possibilty that maybe Watcom have put a lot more

Yeah sure, it could be that Watcom C is way ahead of 680x0 compilers, but
I don't think that this is the only reason.
An example of what I'm saying is this:
I coded a 3d translation routine in assembler and managed 1700 points per
vbl (70hz) on a 486dx-33. I wrote the same routine in C and managed about
1300 points. On the Falcon I tried it out and got over 500 points
in assembler and about 200 in C. I think I'm accomplished enough at
80x86 to justify my statement, and this test was a reasonably fair one.

Why? One 'feature' of 'RISC-ness' is having a large number of general
purpose registers, which the 68k has (to a certain extent). Both have
incarnations that are pipelined, and minimal microcode. So you could
argue that the 68k series is more 'RISC' than the 80x86 series.

>Having more general purpose registers means there is more combinations
>of what is an optimum solution to a problem, hence this makes optimisation
>more difficult than where register usage is fixed.

Oh gee. Shall I use d0 or d1? Big difference. At least you have the
choice. By your argument, most RISC processors are hard to optomise for
(most have general purpose registers).

>An example of what I'm saying is this:

Perhaps you should consider more than just the processor in these systems
before you conclude that the 80486 is faster. How much cache (processor and
secondary)? What memory speed? Bus architecture? Processor speed? Compiler
used (including version number)? Compiler flags? Was the compiled code
optomised for space or speed? What about the assembly? Was the machine
multi-tasking at the time!? Etc. Etc.

So a PC is basically a washing machine with a heap of kludges to make it do
a few things right....? Sounds about right.

BTW, although PCs are *NOT* good, I do admire the excellent flight sims on
them, with really realistic looking scenery, mountains, valleys, etc. When
are we going to get some of that on the Arc? I'm fed up with perfectly
geometrical pyramid mountains, a flat horizon, and swooping over fields to
be confronted by square sheep!

Cheers,
Brian.

I expect the figure for A1200's sold is straight from Commodore. After all the figures that Amiga Format give out are bolstered up to make the sales look amazing.
Apparently 70,000 CD32's just in the UK at Xmas ???
That can't be right, the CD32 is technologically dead so no intelligent person would consider buying it, no Amiga owner would buy it as the cut down versions (i.e. no CD accompanying music) are available. That just leaves people who saw the adverts which even by Ataris standards were very small .....

:>Oh gee. Shall I use d0 or d1? Big difference. At least you have the
:>choice. By your argument, most RISC processors are hard to optomise for
:>(most have general purpose registers).

Yes 'at least you have the choice' means the compiler has to decide
, hence it is more difficult because you have more solutions to a problem
, with human intuition and problem solving it means we are better able
to beat a compiler on a CISC machine. With Risc there are less options for
the compiler because there is less redundancy in the instruction set, hence
a sequence of instructions is more easily proven to be optimum.

:>>An example of what I'm saying is this:

The argument is not over which CPU is faster but whether a compiler can
beat a human on each system, the compiler used is significant, on each
machine I can beat the compiler, however the 80x86 compiler is closer

to me. Now either the 80x86 compilers are X times better than 680x0 one or
there is something inherent in 80x86 which means there is less leway
for human intuition based optimisation.

But with 250,000 A1200's in the UK alone it would be wise for C= to produce a few
books/kernals on the matter ???
How do all the A1200 coders feel about being duped into buying a machine with no support
from its producer ???

Oh dear. I did not say that the 68k WAS more RISC like, I was just pointing
out that it cuts both ways. You could argue that the number of addressing
modes is just 'ONE FEATURE' too.

>Yes 'at least you have the choice' means the compiler has to decide

How can you argue that the 68k is harder to optomise for because it has
more general purpose registers, and yet a RISC processor is easier to
optomise for because it has more general purpose registers? You appear to
be contradicting yourself; please clarify your argument.

>The argument is not over which CPU is faster but whether a compiler can

Yes, I appear to have gotten hold of the wrong end of the stick. But, it is
still an issue. The compilers will not produce the same amount of code
(whether due to different optomisation goals or different code 'density'),
and there will also be a different ratio between compiled and assembled code
size.

Thus you must consider the architecture. Code size will make a difference
to the cache hit ratio. The processor speed, cache size and memory speed
will affect the performance loss associated with a cache miss. This could
be contributing (albeit either way) to the difference between compiled and
(hand) assembled performance.

Yes it does cut both ways, however the nature of the 68k instruction set
means that it is difficult for compilers to use every 'trick', the 80x86
with its less complex modes means that there is less redundancy, hence
it is easier to optimise for.

:>>Yes 'at least you have the choice' means the compiler has to decide

:>more general purpose registers, and yet a RISC processor is easier to
:>optomise for because it has more general purpose registers? You appear to
:>be contradicting yourself; please clarify your argument.

No a RISC processor is easier to optimise for because there is less
redundancy in its instruction set, therefore there are X registers and
less ways of doing a task, lets consider a fragment of 'C' code.

a = array[0];
b = array[1];
c = array[2];
array[0] = c;
array[1] = b;
array[2] = a;

ok.. on a risc machine (archmedies) a compiler might produce something like:

adr r12,array ; r12 -> array[0]
ldr r0,[r12] ; a = array[0]
ldr r1,[r12,#4] ; b = array[1]
ldr r2,[r12,#8] ; c = array[2]
```

```
str [r12],r1 ; array[0] = b
str [r12,#4],r2 ; array[1] = c
str [r12,#8],r0 ; array[2] = a
```

however on a 68000 a compiler might produce

```
lea array(a6),a0
move.l (a0),d0
move.l 4(a0),d1
move.l 8(a0),d2
move.l d1,(a0)
move.l d2,4(a0)
move.l d0,8(a0)
```

now the RISC machine code cannot be optimised, since it only has ATOMIC instructions, the archimedes is not even a good example since it has more addressing modes than most risc machines, however the 68000 code can be optimised to

```
move.l (a0),d0
move.l 4(a0),(a0)
move.l 8(a0),4(a0)
move.l d0,8(a0)
```

hence RISC is easier to optimise for because there are LESS ways of doing things, you don't have to worry about so many 'tricks' and things like peephole optimisation so much. Having more registers is not necessarily better on a CISC architecure, it is better however for writing demos ;-) because you can spend 3 hours optimising a routine to get an extra register , cut down on memory access and hence get that spinning cube running 1fps extra !!

```
:>>The argument is not over which CPU is faster but whether a compiler can
:>>beat a human on each system, the compiler used is significant, on each

```

but surely the compiler knows everything about the architecture and should be better than me?? ;-). How can I beat it? The answer is of course that a compiler is mechanical, WE are not, there is a certain flamboyance involved in hand coding assembler that compilers cannot match at present, RISC machines are simpler more powerful machines, hence compilers can compete better with people.

Doesn't the ARM flush the pipeline in the event of a branch taken? If so, then
the effect is similar to a BDS with a NOP inserted.

So now we are talking about the base config 'for serious purposes' and what
the 'majority of A1200 owners on UseNet' have. Gavan you are so full of BS.
This was certainly not how the arguement started. Now when it becomes apparent
that you can not win the 'which base config is better' war, you change gears
and start talking about a different base of users.

So how many typical consumers buying A1200s are going to have this 6/80 config???
I still think a greater percentage of Falcon owners will have the 4/85 config
compared to the percentage of A1200 owners that will have fast ram or any
other enhancements.

My point was not to imply that you write poor assembly code but to note
that it's often possible to improve the output code from the compiler by
having a solid understanding of the compiler options. On the m68k with
gcc, -fomit-frame-pointer does some good things, and there are other
tweaks that can be made.

|> the effect is similar to a BDS with a NOP inserted.

Sort of, but later chips can catch up the pipeline from the prefetch cache, and the conditional instruction set means that branches are less necessary than on other designs. Modern chips are tending away from the BDS (which is implementation-specific, because the pipeline size may change) and towards superscalar approaches.

I got CorelDRAW! 2.0 to run on Windoze 3.0 on the PC Emulator. Of course, some of the sample clip-art took 10 hours to print, but then if I wanted it for practical use, I'd get ArtWorks. :-)

One advantage - at least you can see how CD's rendering algorithms work (in painstaking detail :-)).

The strategies human programmers apply to optimizing code are very
different then what a compiler will do. Compilers *really* prefer to
have lots of registers available and tend to produce inefficient code
when they get deprived. Having more registers definitely does not make
optimizing code more difficult *if* the registers are equivalent.
Modern compilers start off by making the assumption that they have an
infinite number of registers available and then deal with the
limitations of the physically available registers.

>>> Have you considered the possibilty that maybe Watcom have put a lot more

No the Arm only has pipeline flushes if a change of program counter occurs
, its interesting to note that all instructions are encoded with the
'AL' condition - 'execute always' - hence an instruction like:

str [r12],r0 (or whatever the exact syntax is)

is really

stral [r12],r0 (str ALWAYS)

you can also have

strcs [r12],r0

which means store if carry is set, takes 1 cycle if not taken or 4 cycles
if executed (store takes a few extra cycles...).

Conversely the hardware is so boring in MACs you can argue that no
intelligent person would buy a MAC. Macs are only used for applications
for ease of use, (i.e. for people who are not so computer literate). There
is no 'TECH-SCENE' on the Mac because there is no real hardware to play with
and people who are interested in such stuff (i.e. intelligent people) will
go for something more stimulating.

>Peter Sinclair-Day
>'Only Power PC Macs make it possible'

I prefer the term 'power pc cpu'...

>I already proved you wrong here in Sweden atleast.

I`ve seen INDI in the UK selling A1200s with 80meg HD, 50MHz 030 and 4meg fastRAM for 879 UKP. This compares well with some Falcon prices I`ve seen (Ladbroke computing adverts quote 879 for a 4/65 F030). Silica shop sells this model for 800UKP though.

Its worth noting that you can get an A1200 with 6megs of RAM (4 megs of it fast) for the same price as the cheapest 1 meg Falcon I`ve seen. For the price of 4 meg f030 with HD wou can get an A1200/6megs/HD/SCSI/25Mhz 882 unit which I think is very competitive.

You ain't used Turbo ASM have you??? ;-)
>
> Well...the editor is prolly one of the most subjective issues after
> machine and OS:-B. Any system that forces somebody not to use your
> favourite editor is imho worthless.

No no no, the editor of TurboAssembler is excellent, you've obviously not used this program. Again including loadsa files etc. does NOT slow the system down, you can edit the file in any order you want. Don't make sweeping statements about a program unless you've used it.

OK, I still use Devpac, but only because this is what I'm used to, and also I want macros and assemble to memory(without having to use RAM disk). If only someone would make a cross between Turbo and Devpac ;-)
E.g Macros, PART system, Auto indent, assemble to memory, etc.

In a way I agree with your point about not being able to use your favourite editor, but both Devpac and Turbo have their own editors and it's would be silly to want to use another editor with a prog that already has one.... It's just a case of 'getting used to' the new editor....

>
> >I think a one-pass 'back-patching' assembler would be the fastest 'proper'

:#RH> Oh, yeah, a SCSI 50Mhz w/ 50Mhz FPU accelerator just to play games. Yep.

:#Read the above again - "I've never seen such a card here"

Gee, Rickard getting foolish again. I leave the net for a couple of months
and come back to the same rantings.

Rickard, I've never seen you, prove you exist...8-).

Its just a pity that ARM RISC is very easy to write optomised assembler for
due to it being a well thought out assembler. This makes the change, that on
the Arc pure Assembler code is a hell of a lot faster than C and more
efficient.

Dave

No, not to my knowledge .
